HEAT WAVES IN A THIN UNBOUNDED PLATE LYING ON A CONTINUOUS HOMOGENEOUS FOUNDATION

(Presented by Academician S. L. Sobolev on 13 VII 1956)

In this note we consider problems on heat waves in a thin plate, whose thickness h is small, and therefore it is assumed that the temperature does not vary through the thickness; the specific heat c , density ρ , and thermal-conductivity coefficient λ are constant; the coordinate axes x, y are placed in the middle plane. Suppose that boundary conditions of the third kind are prescribed on the upper plane, while the lower plane is in close contact with a continuous and homogeneous foundation in planes parallel to Oxy . This problem has much in common with problems on the bending of plates on a continuous elastic foundation ⁽¹⁾ and is closely connected with problems of the theory of heat conduction considered in ^(2,3).

We first consider an auxiliary problem. Let heat sources

$q_3 = A_1 \sin \omega t \sin \alpha x \sin \beta y + A_2 \cos \omega t \sin \alpha x \sin \beta y$ be applied to the unbounded plate. We denote the heat flux leaving through the upper plane by q_1 , and through the lower plane by

$q_2 = (A_5 \sin \omega t + A_6 \cos \omega t) \sin \alpha x \sin \beta y$. The temperature of the plate is $T = (A_3 \sin \omega t + A_4 \cos \omega t) \sin \alpha x \sin \beta y$, $q_1 = \delta T$. Substituting their expressions for q_1, q_2, q_3, T into the heat-conduction equation and equating the coefficients of $\sin \omega t$ and $\cos \omega t$, we obtain

$$\begin{aligned} -\lambda h(\alpha^2 + \beta^2)A_3 &= -c\omega A_4 - A_1 + \delta A_3 + A_5, \\ -\lambda h(\alpha^2 + \beta^2)A_4 &= c\omega A_3 - A_2 + \delta A_4 + A_6. \end{aligned} \quad (1)$$

Between the coefficients A_5, A_6 and A_3, A_4 there exist relations determined by the properties of the homogeneous continuous foundation.

Suppose that the properties of the foundation are described by kernels $K_1(r), K_2(r)$, such that, under the action of a unit source varying according to the law $\sin \omega t$, the temperature of the upper surface of the foundation varies according to the law

$T_1 = K_1(r) \sin \omega t + K_2(r) \cos \omega t$. Therefore, if we have a source $\cos \omega t$, then the temperature of the upper surface of the foundation varies according to the law

$$T_1 = K_1(r) \cos \omega t - K_2(r) \sin \omega t.$$

From this it is easy to determine the dependences between A_3, A_4 and A_5, A_6 . Indeed, if the sources $A_5 \sin \omega t \sin \alpha x \sin \beta y$ act on the foundation, then

$$T^{(1)} = P_1(\alpha, \beta) \sin \omega t + P_2(\alpha, \beta) \cos \omega t, \quad (2)$$

where

$$\begin{aligned} P_1(\alpha, \beta) &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} K_1(\sqrt{x^2 + y^2}) \sin \alpha x \sin \beta y \, dx \, dy, \\ P_2(\alpha, \beta) &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} K_2(\sqrt{x^2 + y^2}) \sin \alpha x \sin \beta y \, dx \, dy; \end{aligned} \quad (3)$$

in our case $P_1(\alpha, \beta) = P_1(\gamma)$, $P_2(\alpha, \beta) = P_2(\gamma)$, $\gamma = \sqrt{\alpha^2 + \beta^2}$, therefore

$$T^{(1)} = A_5 [P_1(\gamma) \sin \omega t + P_2(\gamma) \cos \omega t]. \quad (4)$$

If heat sources $A_6 \sin \omega t \sin \alpha x \sin \beta y$ are applied to the surface of the foundation, then

$$T^{(2)} = A_6 [P_1(\gamma) \cos \omega t - P_2(\gamma) \sin \omega t]. \quad (5)$$

For brevity of notation, introduce the designations

$$P_1[\lambda h \gamma^2 + \delta] - c \omega P_2 + 1 = \Phi_1, \quad P_2[\lambda h \gamma^2 + \delta] + c \omega P_1 = \Phi_2. \quad (6)$$

Then

$$\begin{aligned} A_5 &= \frac{A_1 \Phi_1 + A_2 \Phi_2}{\Phi_1^2 + \Phi_2^2}, & A_6 &= \frac{-A_1 \Phi_2 + A_2 \Phi_1}{\Phi_1^2 + \Phi_2^2}, \\ A_3 &= A_1 \frac{\Phi_1 P_1 + \Phi_2 P_2}{\Phi_1^2 + \Phi_2^2} + A_2 \frac{\Phi_2 P_1 - \Phi_1 P_2}{\Phi_1^2 + \Phi_2^2}, \\ A_4 &= A_1 \frac{\Phi_1 P_2 + \Phi_2 P_1}{\Phi_1^2 + \Phi_2^2} + A_2 \frac{\Phi_2 P_2 - \Phi_1 P_1}{\Phi_1^2 + \Phi_2^2}. \end{aligned} \quad (7)$$

It is not difficult to verify that, in essence without loss of generality, one may restrict oneself to the consideration of the case $A_1 \neq 0, A_2 = 0$; then the sought function T will have the form

$$T = \frac{A_1 \sin \alpha x \sin \beta y}{\Phi_1^2 + \Phi_2^2} \{[\Phi_1 P_1 + \Phi_2 P_2] \sin \omega t + [\Phi_1 P_2 + \Phi_2 P_1] \cos \omega t\}; \quad (8)$$

if $q_3 = \sum \sum A_{1mn} \sin \alpha_m x \sin \beta_n y$, then

$$T = \sum \sum \frac{A_{1mn} \sin \alpha_m x \sin \beta_n y}{\Phi_{1mn}^2 + \Phi_{2mn}^2} \{[\Phi_1 P_1 + \Phi_2 P_2] \sin \omega t + [\Phi_1 P_2 + \Phi_2 P_1] \cos \omega t\}. \quad (9)$$

If a point heat source $Q \sin \omega t$ acts on the plate, then

$$T = \frac{Q}{\pi^2} \left\{ \sin \omega t \int_0^\infty \int_0^\infty \frac{\cos \alpha x \cos \beta y d\alpha d\beta}{\tilde{\Phi}_1(\alpha, \beta)} + \cos \omega t \int_0^\infty \int_0^\infty \frac{\cos \alpha x \cos \beta y d\alpha d\beta}{\tilde{\Phi}_2(\alpha, \beta)} \right\}, \quad (10)$$

where

$$\tilde{\Phi}_1(\alpha, \beta) = \frac{\Phi_1^2 + \Phi_2^2}{\Phi_1 P_1 + \Phi_2 P_2}, \quad \tilde{\Phi}_2(\alpha, \beta) = \frac{\Phi_1^2 + \Phi_2^2}{\Phi_1 P_2 + \Phi_2 P_1}.$$

This formula can be written in the form

$$T = \frac{Q}{2\pi} \left[\sin \omega t \int_0^\infty \frac{\gamma J_0(\gamma r) d\gamma}{\tilde{\Phi}_1(\gamma)} + \cos \omega t \int_0^\infty \frac{\gamma J_0(\gamma r) d\gamma}{\tilde{\Phi}_2(\gamma)} \right]. \quad (11)$$

Using the results of (1), one can easily analyze a number of other problems concerning the action of heat sources on a plate and on a rod.

To determine the functions $P_1(\alpha, \beta)$, $P_2(\alpha, \beta)$ in the case where the foundation is a homogeneous half-space, it is necessary to consider the problem of heat waves in a half-space with sources $\sin \alpha x \sin \beta y \sin \omega t$ on the boundary. This problem is equivalent to the problem of bending of a semi-infinite beam with two elastic characteristics, loaded at the end.
