## ON A VARIATIONAL PROBLEM AND QUASILINEAR ELLIPTIC EQUATIONS WITH MANY INDEPENDENT VARIABLES

*(Presented by Academician V. I. Smirnov on 10 VI 1960)*

We shall present results\* obtained by us concerning solutions of the variational problem of finding

$$\inf I(u) = \inf \int_{\Omega} F(x, u, u_{x_k}) dx, \quad x = (x_1, \dots, x_n) \quad (1)$$

under the condition

$$u|_S = \varphi(s), \quad (2)$$

solutions of the first boundary-value problem for quasilinear elliptic equations of general form

$$L_1(u) \equiv a_{ij}(x, u, u_{x_k}) u_{x_i x_j} + a(x, u, u_{x_k}) = 0 \quad (3)$$

and elliptic equations "self-adjoint in the principal part,"

$$M_1(u) \equiv \frac{\partial}{\partial x_i} (a_i(x, u, u_{x_k})) + a(x, u, u_{x_k}) = 0. \quad (4)$$

The main theorems stated below are new also for  $n = 2$ .

**Notation.**  $E_k$  is  $k$ -dimensional Euclidean space;  $\Omega$  is a bounded domain, and  $\Omega'$  is its strictly interior subdomain;  $S$  is the boundary of the domain  $\Omega$ ;  $C_{l,\alpha}(\Omega)$ ,  $W_m^l(\Omega)$  are the usually defined classes of functions <sup>(1,2)</sup>,  $O_l(\Omega)$  is the class of functions  $u(x)$ ,  $x \in \Omega$ , for which derivatives of order  $l-1$  have first differentials, while derivatives up to order  $l$  inclusive are bounded on every compact part of  $\Omega$ . We shall say that the domain  $\Omega$  satisfies condition (A) if there exist constants  $a > 0$  and  $\theta$  in  $(0, 1)$  such that for any ball  $K(\rho)$  with center on  $S$  and radius  $\rho \leq a$  the inequality  $\text{mes}[K(\rho) \cap \Omega] \leq (1 - \theta) \text{mes} K(\rho)$  holds.

§ 1. **A priori estimates.** As S. N. Bernstein showed <sup>(3)</sup>, the following restrictions on the coefficients  $a_{ij}, a$  of the quasilinear elliptic equations (3) are necessary in order that there may exist an a priori estimate of  $\max_{\Omega} |u_{x_i}|$  in terms of  $\max_{\Omega} |u|$  in an arbitrary domain  $\Omega$ :

$$\nu(|u|)(p^2 + 1)^{m/2} \leq a_{ij}(x, u, p_k) p_i p_j \leq \mu(|u|)(p^2 + 1)^{m/2}; \quad (5)$$

$$|a(x, u, p_k)| \leq \mu(|u|)(p^2 + 1)^{m/2}, \quad p = \left( \sum_{k=1}^n p_k^2 \right)^{1/2}, \quad (6)$$

\* Part of these results was reported in the autumn of 1959 at V. I. Smirnov's seminar in Leningrad and in a survey lecture at a meeting of the Leningrad Mathematical Society, and also in December 1959 at I. G. Petrovsky's seminar in Moscow.

where  $\mu(|u|)$  here and below denotes a positive monotonically increasing function,  $\nu(|u|)$  a positive monotonically decreasing function ( $|u|$ ), and  $m$  is some number greater than 1. It is assumed here that each differentiation of the functions  $a_{ij}(x, u, p_k), a(x, u, p_k), a_i(x, u, p_k), F(x, u, p_k)$  with respect to  $p_k$  lowers their order of growth with respect to  $p$  by at least 1, while differentiations with respect to  $x_k$  and  $u$  do not increase them. We shall call these conditions (B). We shall say that the equation is uniformly elliptic if, for  $\sum \xi_i^2 = 1$ ,

$$\nu(|u|)(p^2 + 1)^{m/2-1} \leq a_{ij}(x, u, p_k) \xi_i \xi_j \leq \mu(|u|)(p^2 + 1)^{m/2-1}. \quad (7)$$

**Theorem 1.** Let  $u(x)$  be a solution of equation (3), belonging to the class  $O_3(\Omega) \cap C_1(\bar{\Omega})$  and satisfying condition (2), and let  $a_{ij}(x, u, p_k), a(x, u, p_k) \in O_1(\Omega \times E_1 \times E_n)$ , and suppose that conditions (B) and (7) are fulfilled for them. Then  $\max_{\Omega} |u_{x_i}|$  is estimated in terms of  $\max_{\Omega} |u|$  and  $|\varphi|_{C_{2,0}(S)}$ , if the oscillation of  $u(x)$  in  $\Omega$  is small\* and the boundary  $S$  belongs to  $C_{2,0}$ .

**Theorem 2.** Suppose the conditions of Theorem 1 are fulfilled, except for the assumptions on  $S$  and  $\varphi$ . Then for any  $\Omega' \subset \Omega$ ,  $\max_{\Omega'} |u_{x_i}|$  is estimated in terms of  $\max_{\Omega} |u|$ .

**Theorem 3.** Suppose the conditions of Theorem 1 are fulfilled, except for the assumption on the smallness of the oscillation of  $u(x)$  in  $\Omega$ , and suppose that there exists a sufficiently large  $R > 0$  such that, for  $p \geq R$ ,  $|u| \leq M$ , the quantities

$$\frac{1}{p^{m-2}} \left| \frac{\partial a_{ij}(x, u, p_k)}{\partial u} \right|, \quad \frac{1}{p^m} \frac{\partial a(x, u, p_k)}{\partial u} \quad (8)$$

do not exceed a certain number  $\varepsilon > 0$ , determined by the data of the problem. Then, for the solution  $u$  of problem (3), (2),  $\max_{\Omega} |u_{x_i}|$  can be estimated in terms of  $\max_{\Omega} |u|$  and  $|\varphi|_{C_{2,0}(S)}$ .

Suppose that for equations (4) conditions (B) and (7) are fulfilled, where  $m - 1$  is the order of growth of  $a_i(x, u, p_k)$  with respect to  $p$ . We single out from them an important class of quasilinear equations for which, for large  $p$ , one must have

$$a_i(x, u, p_k)p_i \geq \nu(|u|)p^m, \quad p \gg 1. \quad (9)$$

Let us note that, for linear equations and for equations (3) not containing  $u_{x_i}$  in  $a_{ij}$ , condition (9) is a consequence of the ellipticity condition. For the Euler equation it is a consequence of the natural assumptions, indicated below, concerning  $F$ .

**Theorem 4.** If for (4) only the conditions just enumerated are fulfilled and  $a_i(x, u, p_k) \in O_2(\Omega \times E_1 \times E_n)$ ,  $a(x, u, p_k) \in O_1(\Omega \times E_1 \times E_n)$ , then for any solution  $u$  of equation (4) from  $O_3(\Omega)$  the norm  $|u|_{C_{1,\alpha}(\Omega')}$ , with some  $\alpha > 0$ , can be estimated in terms of  $\max_{\Omega} |u|$ . If, moreover,  $\varphi \in C_{2,0}$ ,  $S \in O_2$ , then the norm  $|u|_{C_{1,\alpha}(\Omega)}$  is estimated in terms of  $\max_{\Omega} |u|$  and  $|\varphi|_{C_{2,0}}$ .

**Theorem 5.** Suppose all the assumptions of Theorem 4 are fulfilled, except for inequality (9). Then, if the functions  $\partial^2 a_i(x, u, p_k)/\partial p_j \partial u$ ,  $\partial^2 a_i(x, u, p_k)/\partial u^2$ ,  $\partial a(x, u, p_k)/\partial u$  have, with respect to  $p$ , orders of growth  $m-2-\varepsilon$ ,  $m-1-\varepsilon$ ,  $m-\varepsilon$  ( $\varepsilon > 0$ ), respectively, then the norm  $|u|_{C_{1,\alpha}(\Omega')}$  is estimated in terms of  $\max_{\Omega} |u|$ . If  $\varphi \in C_{2,0}$ ,  $S \in O_2$ , then the norm  $|u|_{C_{1,\alpha}(\Omega)}$  is estimated in terms of  $\max_{\Omega} |u|$  and  $|\varphi|_{C_{2,0}}$ .

---

\* That is, if  $\text{osc}\{u; \Omega\}$  is less than a certain number (which we do not give here), determined by the constants entering into the conditions of the problem.

§ 2. **Existence theorems.** Consider

$$M_{\tau}(u) \equiv \tau M_1[u] + (1 - \tau)M_0(u) = 0, \quad u|_S = \tau\varphi(s), \quad (10)$$

where

$$M_0(u) = \frac{\partial}{\partial x_i} F_{u_{x_i}}^0 - F_u^0, \quad F^0(x, u, u_{x_k}) = \left( \sum_i u_{x_i}^2 + 1 \right)^{m/2} + u^2.$$

**Theorem 6.** Suppose that: 1) for  $M_1(u)$  the conditions of Theorem 4 or 5 are satisfied; 2)  $a_i(x, u, p_k)$ ,  $a(x, u, p_k)$ , as functions of all their arguments, belong to  $C_{2,\alpha}$ ,  $C_{1,\alpha}$ , respectively; 3)  $S \in C_{2,\alpha}$ ,  $\varphi \in C_{2,\alpha}$ . Then problem (10) has at least

one solution  $u(x, \tau)$  for all  $\tau \in [0, 1]$ , if for all possible solutions  $\max |u(x, \tau)|$  is uniformly bounded. All solutions lie in the space

$$C_{2,\alpha}^\Omega(\bar{\Omega}) \cap C_{3,\alpha}(\Omega).$$

For  $n = 2$  the following theorem is also valid:

**Theorem 7.** Let for equation (3), with  $n = 2$ , the conditions ( ) and (7) be satisfied, and without loss of generality let us assume  $m = 2$ . Suppose that instead of (6) the stronger restriction

$$|a(x, u, p_k)| \leq \mu(|u|)(p^2 + 1)^{1-\varepsilon}, \quad \varepsilon > 0$$

is satisfied. Then the problem

$$L_\tau(u) \equiv \tau L_1(u) + (1 - \tau)(\Delta u - u) = 0, \quad u|_S = \tau\varphi(s)$$

has at least one solution  $u(x, \tau)$  in  $C_{2,\alpha}(\bar{\Omega}) \cap C_{3,\alpha}(\Omega)$  for all  $\tau \in [0, 1]$ , provided only that, for all possible such solutions  $u(x, \tau)$ , the moduli are uniformly bounded. The functions  $a_{ij}$ ,  $a$  must belong to  $C_{1,\alpha}$ ,  $\varphi \in C_{2,\alpha}$ ,  $S \in C_{2,\alpha}$ , and  $\Omega$  is homeomorphic to a disk.

**§ 3. The variational problem.** Let  $F(x, u, p_k)$  have growth order  $m > 1$  with respect to  $p$ , and let each differentiation with respect to  $p_k$  lower the growth order in  $p$  by at least 1, while differentiations with respect to  $x_k$  and  $u$  do not increase it. Suppose, further,\*

$$F(x, u, p_k) \geq \nu_1(|u|)p^m;$$

$$F_{p_i p_j}(x, u, p_k) \xi_i \xi_j \geq \nu_2(|u|)(p^2 + 1)^{(m-2)/2} \sum_i \xi_i^2; \quad (11)$$

$$F_{p_i}(x, u, p_k) p_i \geq \nu_3(|u|)p^m, \quad p \gg 1.$$

Then, as is not difficult to see, for the Euler equation for  $I(u)$  Theorem 4 is valid if  $F \in C_3$ , and Theorem 6 if  $F \in C_{3,\alpha}$ . One of the fundamental questions is that of the conditions on  $F$  under which every generalized solution of the variational problem possesses certain differential properties.

We have proved the following theorems:

**Theorem 8.** Let  $u$  be a generalized solution from  $W_m^1(\Omega)$  of the “conditional” variational problem (1), (2), i.e. the problem to which the condition is added that all comparison functions do not exceed some constant  $M \geq \max_S |u|$ . It will belong to  $C_{0,\alpha}(\Omega)$ , if  $F \in C_1$  and the conditions

$$\mu(|u|)p^m \geq F_{p_i}(x, u, p_k)p_i \geq \nu(|u|)p^m, \quad p \gg 1,$$

$$|F_u(x, u, p_k)| \leq \mu(|u|)p^m. \quad (12)$$

are satisfied.

\* If  $F$  is representable in the form  $F(x, u, p_k) = F'(x, u, p_k) + F''(x, u, p_k)$ ,

where  $F'$  is a positive homogeneous function of  $p_k$  of order  $m$ , and  $\frac{1}{p^m}F'' \rightarrow 0$  as  $p \rightarrow \infty$ , then (11) are consequences of the positivity and convexity of  $F$  and  $F'$ .)

Under the same conditions on  $F$ , every bounded function  $u$  from  $W_m^1(\Omega)$  for which  $\delta I(u) = 0$  belongs to  $C_{0,\alpha}(\Omega)$ . If, moreover,  $\Omega$  satisfies condition (A) and  $\varphi \in C_1$ , then  $u \in C_{0,\alpha}(\bar{\Omega})$ .

**Theorem 9.** Under the conditions on  $F$  formulated at the beginning of the paragraph, every bounded generalized solution  $u(x)$  of the variational problem (1), (2) from the class  $W_m^1(\Omega)$  belongs to  $C_{k,\alpha}(\Omega)$ , if  $F \in C_{k,\alpha}$ ,  $k \geq 3$ , and if

$$\Delta I(u) = I(u + \eta) - I(u) > 0$$

for every sufficiently small local variation  $\eta(x)$ . If, moreover,  $S \in C_{l,\alpha}$ ,  $\varphi \in C_{l,\alpha}$ ,  $2 \leq l \leq k$ , then

$$u \in C_{l,\alpha}(\bar{\Omega}) \cap C_{k,\alpha}(\Omega).$$

For  $m = 2$  the condition  $\Delta I(u) > 0$  may be omitted.

Finally, we give two lemmas which generalize De Giorgi's lemma<sup>4</sup>.

Let  $u \in W_m^1(\Omega)$ ,  $m > 1$ . Denote by  $A_{k,\rho}$  the set of points of the ball  $K(\rho)$  of radius  $\rho$ , lying entirely in  $\Omega$ , for which  $u(x) > k$ , and by  $B_{k,\rho}$  the set of points of  $K(\rho)$  for which  $u < k$ . We shall say that the function  $u$  belongs to the class  $\mathfrak{B}_m(\Omega; M; \gamma, \delta)$  if  $u \in W_m^1(\Omega)$ ,  $|u| \leq M$ , and for every  $K(\rho) \subset \Omega$  the estimate

$$\int_{K(\rho/2)} |\text{grad } u|^m dx \leq \gamma \rho^{n-m} \quad (13)$$

holds.

In addition, for those  $k_1$  for which

$$\max_{A_{k_1,\rho}} |u(x) - k_1| \leq \delta,$$

for any  $\sigma$  from  $(0, 1)$  the inequality

$$\int_{A_{k_1, \rho - \sigma \rho}} |\text{grad } u|^m dx \leq \gamma \text{mes } A_{k_1, \rho} \left\{ \frac{1}{(\sigma \rho)^m} \max_{A_{k_1, \rho}} |u(x) - k_1|^m + 1 \right\}, \quad (14)$$

holds; and for  $k_2$  for which

$$\max_{B_{k_2, \rho}} |k_2 - u(x)| \leq \delta,$$

the inequality

$$\int_{B_{k_2, \rho - \sigma \rho}} |\text{grad } u|^m dx \leq \gamma \text{mes } B_{k_2, \rho} \left\{ \frac{1}{(\sigma \rho)^m} \max_{B_{k_2, \rho}} |k_2 - u(x)|^m + 1 \right\}. \quad (15)$$

holds.

Here  $M, \gamma, \delta$ , and  $m$  are fixed positive numbers, with  $1 < m \leq n$ .

**Lemma 1.** Let  $u \in \mathfrak{B}_m(\Omega; M; \gamma, \delta)$ ; let  $x_0$  be an arbitrary interior point of  $\Omega$ ; and let  $\rho_0$  be the distance from  $x_0$  to the boundary  $S$ . Then for every ball  $K(\rho)$  with center at  $x_0$  and radius  $\rho \leq \rho_0$  the estimate

$$\text{osc}(u, K(\rho)) \leq C \rho_0^{-\alpha} \rho^\alpha$$

holds, where  $C > 0$  and some  $\alpha \in (0, 1)$  are constants for the given class.

Denote by  $\mathfrak{B}_m^0(\Omega; M; \gamma, \delta)$  the class of functions  $u$  from  $\mathfrak{B}_m(\Omega; M; \gamma, \delta)$  satisfying the following requirements: a)  $u \in W_m^1(\Omega)$  and  $u \equiv 0$  outside  $\Omega$ ; b) if the ball  $K(\rho)$  intersects the boundary  $S$ , then inequality (13) is preserved, while inequalities (14) and (15) hold not for all the indicated values  $k_1$  and  $k_2$ , but for  $k_1 \geq 0$  and  $k_2 \leq 0$ , respectively.

**Lemma 2.** Let  $u \in \mathfrak{B}_m^0(\Omega; M; \gamma, \delta)$ , and let  $\Omega$  have property (A). Then for every  $K(\rho)$

$$\text{osc}\{u; K(\rho)\} \leq C \rho^\alpha$$

with constants  $C$  and  $\alpha > 0$  determined for the given class.
