**ON ULTRAPARABOLIC EQUATIONS**

*(Presented by Academician I. G. Petrovskii, February 11, 1963)*

In this paper we consider equations of the form

$$\sum_{i,j=1}^n a_{ij} \frac{\partial^2 u}{\partial x_i \partial x_j} + \sum_{i=1}^n b_i \frac{\partial u}{\partial x_i} = a_0 \frac{\partial u}{\partial t} + \sum_{k=1}^m a_k \frac{\partial u}{\partial y_k} + bu + f, \quad (1)$$

where

$$\sum_{i,j=1}^n a_{ij}(x, y, t) \xi_i \xi_j \geq \mu \sum_{i=1}^n \xi_i^2, \quad \mu = \text{const} > 0, \quad a_0(x, y, t) > \lambda > 0.$$

We shall call such equations **ultraparabolic**. Interest in equations of the form (1) arose in connection with the works of A. N. Kolmogorov <sup>(1,2)</sup>, where certain problems of probability theory lead to the consideration of such equations. Equations of this type also occur in boundary-layer theory, in the theory of Brownian motion, etc. (see <sup>(3,4)</sup>). In the case  $n = 1$ , equation (1) was studied in <sup>(5,6)</sup>. The solution of the boundary-value problem in these works was obtained by the Rothe method.

In the present paper we shall obtain a generalized solution of the boundary-value problem and of the Cauchy problem for equation (1), and prove uniqueness of the solution of these problems.

1. Let  $E_n$  be the space of points with coordinates  $(x_1, \dots, x_n)$ , and  $E_m$  the space  $(y_1, \dots, y_m)$ . By  $(x, y, t)$  we shall denote points of the space  $E_n \times E_m \times E_1$ . Let  $\Omega$  be a domain in  $E_n$  with twice continuously differentiable boundary  $\sigma$ , and let  $R$  be the parallelepiped  $\{0 < y_k < \beta_k, 0 < t < T\}$ ,  $k = 1, \dots, m$ ;  $G = \Omega \times R$  is a domain in  $E_n \times E_m \times E_1$ . By  $W_{2,x}^1(G)$  we denote the Hilbert space of functions with norm

$$\|u\|_{W_{2,x}^1}^2 = \int_G \left[ u^2 + \sum_{i=1}^n \left( \frac{\partial u}{\partial x_i} \right)^2 \right] dG, \quad \|u\|_{L_2(G)}^2 = \int_G u^2 dG.$$

We define the norm of the space  $W_{2,y,t}^1(G)$  by the equality

$$\|u\|_{W_{2,y,t}^1}^2 = \int_G \left[ u^2 + \sum_{i=1}^m \left( \frac{\partial u}{\partial y_i} \right)^2 + \left( \frac{\partial u}{\partial t} \right)^2 \right] dG;$$

the norm of the space  $H(G)$  by the equality

$$\begin{aligned} \|u\|_{H(G)}^2 = \int_G & \left[ u^2 + \sum_{i=1}^n \left( \frac{\partial u}{\partial x_i} \right)^2 + \sum_{i=1}^m \left( \frac{\partial u}{\partial y_i} \right)^2 + \left( \frac{\partial u}{\partial t} \right)^2 + \sum_{i,j=1}^n \left( \frac{\partial^2 u}{\partial x_i \partial x_j} \right)^2 \right. \\ & \left. + \sum_{i,k=1}^{n,m} \left( \frac{\partial^2 u}{\partial y_k \partial x_i} \right)^2 + \sum \left( \frac{\partial^2 u}{\partial x_i \partial t} \right)^2 \right] dG, \end{aligned}$$

and the norm of the space  $W_2^1(G)$  by the equality

$$\|u\|_{W_2^1(G)} = \|u\|_{W_{2,x}^1} + \|u\|_{W_{2,y,t}^1}.$$

2. We shall assume:

I. The  $a_{ij}$  are continuous in the closed domain  $\overline{G}$  and have bounded derivatives of the form  $\partial a_{ij}/\partial x_i$ ,  $\partial a_{ij}/\partial y_k$ ,  $\partial a_{ij}/\partial t$ ,  $\partial^2 a_{ij}/\partial x_i \partial x_j$ ,  $\partial^2 a_{ij}/\partial x_i \partial y_k$ ,  $\partial^2 a_{ij}/\partial x_i \partial t$ ,  $i, j = 1, \dots, n$ ;  $k = 1, \dots, m$ .

II. The  $b_i$  are bounded in  $\overline{G}$ , the coefficient  $b$  is bounded below,  $b \in L_2(G)$ ,  $a_k \in L_2(G)$ , and the derivatives  $\partial a_s/\partial y_k$ ,  $\partial a_s/\partial t$ ,  $\partial b/\partial y_k$ ,  $\partial b/\partial t$ ,  $\partial b_i/\partial y_k$ ,  $\partial b_i/\partial t$ ,  $\partial a_0/\partial y_k$ ,  $\partial a_0/\partial t$  ( $i = 1, \dots, n'$ ;  $s, k = 1, 2, \dots, m$ ) are bounded in  $\overline{G}$ .

III. The  $a_k$  do not change sign for  $y_k = 0$  and  $y_k = \beta_k$ ,  $k = 1, \dots, m$ .

Divide the boundary  $S$  of the domain  $G$  into two parts:  $S = S_1 + S_2$ . If  $a_k \geq 0$  for  $y_k = 0$  ( $k = 1, \dots, m$ ), then assign the boundary  $y_k = 0$  to  $S_1$ , otherwise to  $S_2$ ; if  $a_k \leq 0$  for  $y_k = \beta_k$ , then assign the boundary  $y_k = \beta_k$  to  $S_1$ , otherwise to  $S_2$ . Assign the boundary  $\sigma \times R$  and  $t = 0$  to  $S_1$ , and the boundary  $t = T$  to  $S_2$ .

**Theorem 1.** *Suppose that the coefficients of equation (1) satisfy conditions I, II, III. If the function  $f(x, y, t) \in W_{2,y,t}^1(G)$  and  $f|_{S_1 - \sigma \times R} = 0$ , then there exists a unique function of the class  $H(G)$  which almost everywhere in  $G$  satisfies equation (1) and assumes zero values on  $S_1$ .*

We indicate the main ideas of the proof of this theorem. Consider the domain  $G_1 = \Omega \times R_1$ , where  $R_1$  in  $E_m \times E_1$  is given by the inequalities  $\{0 \leq t \leq T + \delta, \delta > 0, \alpha_k \leq y_k \leq \gamma_k, k = 1, \dots, m\}$  and  $\alpha_k \leq 0, \gamma_k \geq \beta_k$ . If the boundary  $y_k = 0$  belongs to  $S_1$ , then  $\alpha_k = 0$ , otherwise  $\alpha_k = -\delta$ . Similarly, if the boundary  $y_k = \beta_k \subset S_1$ , then  $\gamma_k = \beta_k$ , otherwise  $\gamma_k = \beta_k + \delta$ .

Consider in  $G_1$  the auxiliary equation of elliptic type:

$$\sum_{i,j=1}^n a_{ij}^\varepsilon \frac{\partial^2 u}{\partial x_i \partial x_j} + \sum_{k=1}^m \varepsilon \frac{\partial^2 u}{\partial y_k^2} + \varepsilon \frac{\partial^2 u}{\partial t^2} + \sum_{i=1}^n b_i^\varepsilon \frac{\partial u}{\partial x_i} = a_0^\varepsilon \frac{\partial u}{\partial t} + \sum_{k=1}^m a_k^\varepsilon \frac{\partial u}{\partial y_k} + a_0^\varepsilon \frac{\partial u}{\partial t} + b^\varepsilon u + f^\varepsilon, \quad (2)$$

where  $a_{ij}^\varepsilon, b_i^\varepsilon, a_k^\varepsilon, a_0^\varepsilon, f^\varepsilon, b^\varepsilon$  are infinitely differentiable functions converging in the mean as  $\varepsilon \rightarrow 0$  in  $G$  to the corresponding coefficients of equation (1),  $\varepsilon > 0$ . At the same time, all derivatives of the coefficients of equation (2) indicated in conditions I and II are uniformly bounded with respect to  $\varepsilon$ . It is easy to see that the coefficients of equation (2) can be chosen so that the following conditions are satisfied:

1)

$$\sum_{i,j=1}^n a_{ij}^\varepsilon \xi_i \xi_j \geq \frac{\mu}{2} \sum_{i=1}^n \xi_i^2 \quad \text{for all } (x, y, t) \in G_1.$$

2)  $a_0^\varepsilon(x, y, T + \delta) = 0, a_0^\varepsilon > 0$  in  $G, a_k^\varepsilon|_{y_k=\alpha_k} = 0$ , if  $\alpha_k < 0$ , and  $a_k^\varepsilon|_{y_k=\gamma_k} = 0$ , if  $\gamma_k > \beta_k$ . On the boundary of  $G_1$  determined by the equalities  $y_k = \alpha_k = 0$  or  $y_k = \gamma_k = \beta_k$ , the functions  $a_k^\varepsilon$  and  $a_k$  have the same sign.

3) The function  $f^\varepsilon$  is finite in  $G_1$  and the norms

$$\|f^\varepsilon\|_{W_{2,y,t}^1(G_1)}$$

are uniformly bounded with respect to  $\varepsilon$ .

4)  $b^\varepsilon > b_0 > 0$ , if  $b > b_0$ .

For equation (2) consider in the domain  $G_1$  the following boundary-value problem:

$$u_\varepsilon = 0 \quad \text{on the boundary of } G_1. \quad (3)$$

It can be shown that the solution  $u_\varepsilon$  of problem (2), (3) has all second-order derivatives continuous in  $\overline{G_1}$ . For the solution  $u_\varepsilon$  there are a priori estimates

$$\int_{G_1} \left[ \sum_{i=1}^n \left( \frac{\partial u_\varepsilon}{\partial x_i} \right)^2 + \varepsilon \sum_{k=1}^m \left( \frac{\partial u_\varepsilon}{\partial y_k} \right)^2 + \varepsilon \left( \frac{\partial u_\varepsilon}{\partial t} \right)^2 + u_\varepsilon^2 \right] dG_1 \leq M \|f^\varepsilon\|_{L_2(G_1)}^2; \quad (4)$$

$$\begin{aligned} & \int_{G_1} \left[ \sum_{i,j=1}^n \left( \frac{\partial^2 u_\varepsilon}{\partial x_i \partial x_j} \right)^2 \right] dG_1 + \int_{G_1} \left[ \sum_{\substack{i=1,\dots,n \\ k=1,\dots,m}} \left( \frac{\partial^2 u_\varepsilon}{\partial x_i \partial y_k} \right)^2 + \sum_{i=1}^n \left( \frac{\partial^2 u_\varepsilon}{\partial x_i \partial t} \right)^2 + \varepsilon \sum_{k,\nu=1}^m \left( \frac{\partial^2 u_\varepsilon}{\partial y_\nu \partial y_k} \right)^2 + \right. \\ & \left. + \sum_{k=1}^m \varepsilon \left( \frac{\partial^2 u_\varepsilon}{\partial y_k \partial t} \right)^2 + \varepsilon \left( \frac{\partial^2 u_\varepsilon}{\partial t^2} \right)^2 + \sum_{k=1}^m \left( \frac{\partial u_\varepsilon}{\partial y_k} \right)^2 + \left( \frac{\partial u_\varepsilon}{\partial t} \right)^2 \right] dG_1 \leq M \|f^\varepsilon\|_{W_{2,y,t}^1(G_1)}^2, \end{aligned} \quad (5)$$

where  $M$  does not depend on  $\varepsilon$ . Estimate (4) can be obtained by multiplying (2) by  $u_\varepsilon$ , integrating this equality over  $G_1$ , and transforming it by integration by parts. The second integral on the left-hand side of (5) can be estimated if equation (2) is multiplied by  $\partial^2 u_\varepsilon / \partial y_k^2$  ( $k = 1, \dots, m$ ) and  $\partial^2 u_\varepsilon / \partial t^2$ , the resulting  $m+1$  equalities are integrated over  $G_1$ , added, and some of the resulting integrals are transformed by integration by parts. The first integral on the left-hand side of (5) is then estimated in the same way as the second derivatives of an elliptic-type equation are estimated in the  $L_2$  norm (see, for example, (7), § 2). With the aid of estimates (4) and (5) it is easy to show that there exists a limit of  $u_\varepsilon$  as  $\varepsilon \rightarrow 0$  along a certain subsequence  $\varepsilon_k$ , and the limiting function  $u \in H(G)$  almost everywhere satisfies equation (1) in  $G$  and the condition  $u|_{S_1} = 0$ . The uniqueness of such a solution is proved with the aid of an energy inequality.

3. A function  $u(x, y, t) \in W_{2,x}^1(G)$  is called a **weak generalized solution** of equation (1) in the domain  $G$  with the condition  $u|_{S_1} = 0$  if, for every function  $\Phi \in W_2^1(G)$  satisfying the conditions  $\Phi|_{\sigma \times R} = 0$ ,  $\Phi|_{S_2} = 0$ , the integral identity holds:

$$\int_G \left\{ - \left[ \sum_{i,j=1}^n a_{ij} \frac{\partial u}{\partial x_i} \frac{\partial \Phi}{\partial x_j} + \frac{\partial a_{ij}}{\partial x_j} \frac{\partial u}{\partial x_i} \Phi \right] + \sum_{i=1}^n b_i \frac{\partial u}{\partial x_i} \Phi + \sum_{k=1}^m \left( a_k \frac{\partial \Phi}{\partial y_k} u + \frac{\partial a_k}{\partial y_k} \Phi u \right) + a_0 \frac{\partial \Phi}{\partial t} u + \frac{\partial a_0}{\partial t} u \Phi - (bu + f) \Phi \right\} dG = 0.$$

**Theorem 2.** Suppose the coefficients of equation (1) satisfy conditions I, II, III. If  $f \in L_2(G)$ , then there exists a unique weak generalized solution of equation (1) with the condition  $u|_{S_1} = 0$ .

The existence of such a solution is proved using the solutions  $u_\varepsilon$  of problem (2), (3) and the a priori estimate (4). The uniqueness of such a solution is easily obtained by using the existence of a solution of the equation adjoint to (1), which can be constructed according to Theorem 1.

4. Consider the Cauchy problem for equation (1) in the layer  $Q\{0 < t \leq T, (x, y) \in E_n \times E_m\}$  with the initial condition

$$u(x, y, 0) = 0, \quad (x, y) \in E_n \times E_m. \quad (6)$$

A function  $u(x, y, t) \in W_2^1(Q)$  will be called a **generalized solution** of problem (1), (6) if  $u|_{t=0} = 0$  and, for every function  $\Phi$  from  $W_2^1(Q)$  that is finite in  $x$  and  $y$ , the integral identity holds

$$\int_Q \left\{ - \left[ \sum_{i,j=1}^n a_{ij} \frac{\partial u}{\partial x_i} \frac{\partial \Phi}{\partial x_j} + \frac{\partial a_{ij}}{\partial x_j} \frac{\partial u}{\partial x_i} \Phi \right] + \sum_{i=1}^n b_i \frac{\partial u}{\partial x_i} \Phi - \left[ \sum_{k=1}^m a_k \frac{\partial u}{\partial y_k} + a_0 \frac{\partial u}{\partial t} + bu + f \right] \Phi \right\} dQ = 0.$$

**Theorem 3.** If the coefficients  $b_i$ ,  $b$ , and all derivatives entering conditions I, II are bounded in  $Q$ , and  $f \in W_{2,y,t}^1(Q)$ ,  $f|_{t=0} = 0$ , then there exists a unique generalized solution of the Cauchy problem (1), (6).

To prove this theorem one considers the solution  $u_\varepsilon$  of equation (2) in the domain  $G_\varepsilon = \Omega_\varepsilon \times R_\varepsilon$ , equal to zero on the boundary  $G_\varepsilon$ , where

$$\Omega_\varepsilon = \left\{ \sum_{i=1}^n x_i^2 \leq A_\varepsilon \right\}, \quad R_\varepsilon = \{|y_k| \leq \beta^\varepsilon, 0 \leq t \leq T + \delta\}.$$

The coefficients (2) approximate the coefficients of equation (1) as  $\varepsilon \rightarrow 0$ . Denote the second integral in the left-hand side of (5) by  $I_1$ . For solutions  $u_\varepsilon$  in the domain  $G_\varepsilon$ , estimate (4) is valid, as is the estimate

$$I_1 \leq M \|f^\varepsilon\|_{W_{2,y,t}^1(G_\varepsilon)}^2,$$

where  $M$  does not depend on  $\varepsilon$ . Letting  $\varepsilon$  tend to zero, and  $A_\varepsilon$  and  $\beta^\varepsilon$  to infinity, and choosing a sequence  $u_\varepsilon$  that converges weakly in  $W_2^1$  in any finite domain, we obtain in the limit a solution of problem (1), (6). The uniqueness of such a solution follows from the energy inequality.

From the theorem proved there follows, in particular, solvability under the indicated conditions of the Cauchy problem for the equation of Brownian motion in phase space:

$$\frac{\partial u}{\partial t} = \sum_{i=1}^m x_i \frac{\partial u}{\partial y_i} + a \sum_{i=1}^m \frac{\partial^2 u}{\partial x_i^2} + \sum_{i=1}^m b_i \frac{\partial u}{\partial x_i} + f(x, y, t), \quad a > 0.$$

One may consider the Cauchy problem for equation (1) in the class of functions increasing in  $x$  and  $y$  at infinity, analogously to how this is done in § 10 of paper (7).

5. Another formulation of the Cauchy problem is also possible, when the variables  $(t, y_1, \dots, y_\nu)$ ,  $\nu \leq m$ , play the same role as the time  $t$ , while  $(x_1, \dots, x_n, y_{\nu+1}, \dots, y_m)$  are regarded as spatial variables. In this case the solution is sought in the domain  $\{0 \leq t \leq T, 0 \leq y_s \leq \beta_s, s = 1, \dots, \nu\}$ , and the initial conditions must be prescribed at  $t = 0$  and on those parts of the boundary  $y_s = 0$  and  $y_s = \beta_s$  that belong to  $S_1$ . For such a problem a theorem analogous to Theorem 3 is valid.

This work was carried out under the supervision of O. A. Oleinik. The author expresses her sincere gratitude to her.
