## THE FIRST AND SECOND BOUNDARY-VALUE PROBLEMS FOR ELLIPTIC EQUATIONS DEGENERATING AT A FINITE NUMBER OF INTERIOR POINTS

*(Presented by Academician I. N. Vekua, March 21, 1963)*

Equations of elliptic type that allow degeneration of order, or, in other terminology <sup>(4,5)</sup>, equations with singular coefficients, are the subject of the works <sup>(1,2,4,5)</sup>. In the works of L. G. Mikhailov <sup>(4,5)</sup>, equations were investigated that degenerate on certain manifolds  $M_k$  of dimension  $k$  ( $0 \leq k \leq n - 1$ ;  $n$  is the number of independent variables in the equation). He studied the manifold of solutions, the first and second boundary-value problems, and solutions in the whole space. The apparatus of the investigation is a new class of special integral equations <sup>(5)</sup>. In the case  $k = 0$ , he considered the equation

$$r^\alpha \Delta u + r^\alpha - 1 \sum_{i=1}^n b_i(x) u_{x_i}(x) + c(x)u(x) = f(x)$$

for  $\alpha = 2$ ,  $n > 2$  and for  $\alpha < 2$ ,  $n = 2$ ; here  $r$  is the distance from the point  $x$  to the point of degeneration. Generalized solutions of elliptic equations degenerating at isolated points were considered by V. K. Zakharov <sup>(2)</sup>, and those degenerating on manifolds  $M_k$  by V. P. Glushko <sup>(1)</sup>. In the case of a second-order equation, point singularities of order  $\alpha < 2$  were studied. Singularities of higher order are admitted only for a very particular type of equations.

In the present work we study the generalized maximum principle, the first and second internal and external boundary-value problems, and solutions of the equation in the whole space. All these results are obtained for any equation for which the generalized maximum principle holds <sup>(7)</sup>.

### 1. Internal boundary-value problems

Let a finite closed domain  $S$  with boundary  $\Gamma$  be given, and let the origin  $O$  be interior to  $S$ . Denote by  $S_0$  the domain  $S - \Gamma - O$ . Consider in  $S$  the elliptic equation

$$Lu \equiv r^\mu \sum_{i,j=1}^n a_{ij}(x) u_{x_i x_j}(x) + r^\nu \sum_{i=1}^n b_i(x) u_{x_i}(x) + c(x)u(x) = f(x). \quad (1)$$

Here  $x = (x_1, x_2, \dots, x_n)$  denotes a point of  $n$ -dimensional space,  $r$  is the distance from the point  $x$  to the origin, and  $\mu$  and  $\nu$  are constants. Suppose that the coefficients of equation (1) satisfy the condition of uniform ellipticity of the operator  $L$  in any closed domain  $S - \bar{B}(O, \varepsilon)$ , where  $\bar{B}(O, \varepsilon)$  is the ball with center at the origin and arbitrarily small radius  $\varepsilon$ . Assume the coefficients  $c(x) \leq 0$ ,  $a_{ij}(x)$ ,  $b_i(x)$  to be bounded in  $S$ . The functions  $a_{ij}(x)$  are continuous at the point  $x = 0$ , and, without loss of generality, we may suppose that they have the form

$$a_{ij}(0) = \begin{cases} 1, & \text{if } i = j = 1, 2, \dots, m; \quad 0 \leq m \leq n, \\ 0, & \text{for the remaining } i, j = 1, 2, \dots, n. \end{cases} \quad (2)$$

Denote by  $C^2(S, \beta)$  the class of functions  $u(x)$  twice continuously differentiable in  $S_0$  and satisfying the condition  $u(x) = o(r^{-\beta})$  as  $r \rightarrow 0$ , where  $\beta$  is a positive number. We shall call the operator  $L$   $\beta$ -normal if, in the ball  $B(O, \delta)$  of sufficiently small radius  $\delta$ , the inequality

$$Lr^{-\beta} \leq 0 \quad (3)$$

holds.

Let us note some special cases in which condition (3) is fulfilled.

A. Let  $m > 2$  and  $c(x) \leq 0$ . Then inequality (3) will hold provided

$$\sup_{0 \leq r \leq \delta} \left( r^{\nu-\mu} \sum_{i=1}^n b_i(x) x_i \right) < m - 2 - \beta.$$

B. Let  $m \geq 2$ ,  $2 \leq \mu \leq \nu + 1$ , and  $\sup c(x) < 0$  in  $B(O, \delta)$ . Then, whatever the bounded coefficients  $c(x) \leq 0$  and  $b_i(x)$  may be, there exists  $\beta > 0$  such that inequality (3) is satisfied.

**Theorem 1.** Let  $u(x)$  be a nonconstant function, continuous in  $S_0 + \Gamma$ , of class  $C^2(S, \beta)$ , satisfying in  $S_0$  the inequality  $Lu \geq 0$ , where the operator  $L$  is  $\beta$ -normal. Then, if  $c(x) \equiv 0$ ,

$$u(x) \leq \max_{\Gamma} u(x)$$

in  $S$ , and equality is possible only on  $\Gamma$ ; if  $c(x) \leq 0$ , then

$$u(x) \leq \max_{\Gamma}(u(x), 0)$$

in  $S$ , and equality is possible only on  $\Gamma$  and at the point  $x = 0$ .

From Theorem 1 one easily obtains analogues of Giraud's theorem and of the uniqueness theorem for solutions of boundary-value problems in the class of functions  $C^2(S, \beta)$  (7). Suppose that on  $\Gamma$  one of the conditions is prescribed:

$$u(x)|_{\Gamma} = \Psi(x); \quad (4)$$

$$\frac{\partial u}{\partial \bar{\nu}} + b(x)u = \Psi(x), \quad (5)$$

where  $\bar{\nu}$  is the exterior conormal to  $\Gamma$  with respect to  $S$ .

**Theorem 2.** Let the coefficients  $c(x) \leq 0$ ,  $a_{ij}(x)$ ,  $b_i(x)$ , and  $f(x)$  be bounded in the closed domain  $S$  and of class  $A^{(1,\lambda)}$ , i.e.  $\Gamma$  is a Lyapunov surface, and let them satisfy the conditions

$$a_{ij}(x) \in C^{(1,\lambda)}, \quad b_i(x), c(x) \in C^{(0,\lambda)} \quad \text{in } S_0 + \Gamma,$$

the function  $f(x)$  is continuous in  $S_0 + \Gamma$  and belongs to the class  $C^{(0,\lambda)}$  in  $S_0$ . Let the operator  $L$  be  $\beta$ -normal for some  $\beta > 0$ , and suppose there exists a sufficiently small ball  $B(O, R)$  such that  $f(x) \equiv 0$  in it. Then the problem (1), (4) for any continuous function  $\Psi(x)$  (the problem (1), (5) for any continuous  $b(x) \geq 0$  and  $\Psi(x)$ , with at least one of the functions  $c(x)$  and  $b(x)$  not identically zero) has, and moreover has uniquely, a solution  $u(x)$  bounded in  $S$ .

**Theorem 3.** Let the conditions of Theorem 2 be satisfied, except for the equality  $f(x) \equiv 0$ , in place of which we require boundedness of  $f(x)/c(x)$  in some ball  $B(O, R)$ . Then the assertion of Theorem 2 is valid.

If the function  $f(x)/c(x)$  has the unique limit

$$(f/c)_0 = \lim_{x \rightarrow 0} f(x)/c(x)$$

and the inequality  $Lr^{\beta_1} \leq 0$  is satisfied in  $B(O, d)$  for some  $\beta_1 > 0$  and  $d > 0$ , then the solution  $u(x)$  will have the unique limit

$$(u)_0 = \lim_{x \rightarrow 0} u(x),$$

and moreover the equality

$$(u)_0 = \left(\frac{f}{c}\right)_0. \quad (6)$$

Formula (6) indicates the singular character of equation (1), since in the regular case the value  $(u)_0$  depends on the boundary condition.

**Remark to Theorems 2 and 3.** Theorems 2 and 3 remain valid if, in the condition of  $\beta$ -normality (3), instead of  $r^{-\beta}$  one takes an arbitrary function  $w(x) > 0$  such that  $w(x) \rightarrow \infty$  as  $x \rightarrow 0$  and  $Lw \leq 0$  in  $B(0, d)$ . In the second condition of Theorem 3, instead of  $r^{\beta_1}$  one may take a function  $v(x) > 0$  such that  $v(x) \rightarrow 0$  as  $x \rightarrow 0$  and  $Lv \leq 0$  in  $B(0, d)$ .

**2. External boundary-value problems.** Denote by  $S^-$  the domain which is the complement of the bounded closed domain  $S$  to the whole space  $E_n$ . Consider in  $S^-$  the elliptic equation

$$L'u \equiv r^{\mu'} \sum_{i,j=1}^n a'_{ij}(x)u_{x_i x_j}(x) + r^{\nu'} \sum_{i=1}^n b'_i(x)u_{x_i}(x) + c'(x)u(x) = f'(x), \quad (1')$$

where  $\mu', \nu'$  are constants. Suppose that the operator  $L'$  is uniformly elliptic in any closed domain  $B(0, A) - S$ , where  $A > 0$  is sufficiently large. Let the coefficients  $c'(x) \leq 0$ ,  $a'_{ij}(x)$ ,  $b'_i(x)$ , and  $f'(x)$  be bounded in  $S^-$ , and let the functions  $a'_{ij}(x)$  have, respectively, unique limits which are defined by the equalities

$$(a'_{ij})_{\infty} = \lim_{x \rightarrow \infty} a'_{ij}(x) = \begin{cases} 1 & \text{for } i = j = 1, 2, \dots, m'; \quad 0 \leq m' \leq n, \\ 0 & \text{for the remaining } i, j = 1, 2, \dots, n. \end{cases} \quad (2')$$

Denote by  $C^2(S^-, \beta^-)$  the class of functions  $u(x)$ , twice continuously differentiable in  $S^-$ , satisfying the condition  $u(x) = o(r^{\beta'})$  as  $r \rightarrow \infty$ , where  $\beta'$  is a positive number. We shall call the operator  $L'$   $\beta'$ -normal if, outside some ball  $B(0, B)$  of sufficiently large radius  $B$ , the inequality

$$L'r^{\beta'} \leq 0 \quad (3')$$

is satisfied.

For  $\beta'$ -normal operators, theorems analogous to Theorems 1-3 hold. We state two of them.

**Theorem 2'.** Suppose the coefficients  $c'(x) \leq 0$ ,  $a'_{ij}(x)$ ,  $b'_i(x)$ ,  $f'(x)$  are bounded in the closed domain  $S^-$ ,  $S \in A^{(1, \lambda)}$ , and satisfy the conditions:  $a'_{ij}(x) \in C^{1, \lambda}$ ;  $b'_i(x)$ ,  $c'(x) \in C^{(0, \lambda)}$  in  $S^- + \Gamma$ ,  $f'(x)$  is continuous in  $S^- + \Gamma$ , and  $u$  belongs to the class  $C^{(0, \lambda)}$  in  $S^-$ . Suppose the operator  $L'$  is  $\beta'$ -normal for some  $\beta' > 0$  and that there exists a ball  $B(0, R_1)$  so large that  $f'(x) \equiv 0$  outside

it. Then problem (1'), (4) for any continuous function  $\Psi(x)$  (problem (1'), (5) for any continuous  $b(x) \leq 0$  and  $\Psi(x)$ , with, among the functions  $c'(x)$  and  $b(x)$ , at least one not identically equal to zero) has, and moreover has uniquely, a solution  $u(x)$  bounded in  $S^-$ .

**Theorem 3'.** Suppose the conditions of Theorem 2' are fulfilled, except for the equality  $f'(x) \equiv 0$ , in place of which we require the boundedness of  $f'(x)/c'(x)$  outside some ball  $B(0, R_1)$ . Then the assertion of Theorem 2' is valid.

If the function  $f'(x)/c'(x)$  has a unique limit

$$(f'/c')_\infty = \lim_{x \rightarrow \infty} f'(x)/c'(x)$$

and the inequality  $L'r^{-\beta_1} = 0$  is satisfied outside  $B(0, d)$  for some  $\beta_1 > 0$  and  $d > 0$ , then the solution  $u(x)$  will have a unique limit

$$(u)_\infty = \lim_{x \rightarrow \infty} u(x),$$

and the equality

$$(u)_\infty = \left( \frac{f'}{c'} \right)_\infty \quad (7')$$

holds.

### 3. Solution of the equation in the whole space

Consider the elliptic equation

$$\mathcal{L}u \equiv \sum_{i,j=1}^n A_{ij}(x)u_{x_i x_j}(x) + \sum_{i=1}^n B_i(x)u_{x_i}(x) + C(x)u(x) = F(x) \quad (8)$$

in the whole space  $E_n$ . Denote by  $K(a, b)$  the domain  $a \leq r(x) \leq b$ . Suppose that the operator  $\mathcal{L}$  is uniformly elliptic in every domain  $K(\varepsilon, \varepsilon^{-1})$ , where  $\varepsilon$  is an arbitrarily small positive number. Let equation (8) reduce in some ball  $B(O, \delta)$  to equation (1), and outside the ball  $B(O, \delta^{-1})$  to (1'). Consequently, we shall consider an equation with two singular points  $O, \infty$  (cf. (5)).

**Theorem 4.** Let the coefficients of the operator  $\mathcal{L}$  in any domain  $K(\varepsilon, \varepsilon^{-1})$  satisfy the conditions:

$$A_{ij}(x) \in C^{(1,\lambda)}; \quad B_i(x), C(x) \leq 0; \quad F(x) \in C^{(0,\lambda)}.$$

Then the following results hold:

- 1) If there exists such a small  $R$  that  $F(x) \equiv 0$  in  $B(O, R)$ , the conditions of Theorem 2 are satisfied, and all the conditions of Theorem 3' are satisfied outside  $B(O, R^{-1})$ , then there exists, and moreover uniquely, a bounded in  $E_n$  solution  $u(x)$  of equation (8), regular for  $0 < r < \infty$ , for which equality (7) holds.
- 2) If the first part of the conditions of Theorem 3 is satisfied in  $B(O, R)$  and all the conditions of Theorem 3' outside  $B(O, R^{-1})$ , then assertion 1) holds. If the second part of Theorem 3 is satisfied, then the solution  $u(x)$  satisfies equality (6).

We note that in Theorem 4 the points  $O$  and  $\infty$  may be interchanged, and we obtain a new result analogous to Theorem 4.

The proof of Theorems 2-4 is carried out according to the following scheme. By a method analogous to that used by M. V. Keldysh<sup>(3)</sup>, the existence of a solution of the first boundary-value problem for the ball  $B(O, R)$  or for the exterior of the ball  $B(O, R^{-1})$  is proved. Uniqueness of the solution follows from the generalized maximum principle. For domains of general form the boundary-value problems are solved by a modified method of alternation<sup>(8)</sup>, based on the results of<sup>(7)</sup>.

I take this opportunity to express my gratitude to L. G. Mikhailov for supervising this work.
