## **IMPROVING THE CONVERGENCE OF METHODS OF SUCCESSIVE APPROXIMATIONS FOR LINEAR EQUATIONS**

*(Presented by Academician A. Yu. Ishlinskii, December 30, 1963)*

The number of approximations required in solving a system of linear equations

$$\bar{x} = B\bar{x} + \bar{b} \quad (1)$$

by the method of successive approximations

$$\bar{x}_{n+1} = B\bar{x}_n + \bar{b} \quad (2)$$

may be large if the norm of the matrix  $B$  is close to 1, the initial approximation  $\bar{x}_0$  is far from the solution, and the result must be obtained with high accuracy. Below a method is proposed for improving convergence, in which  $s$  approximations are equivalent to  $n = 2^{s-1}$  ordinary approximations.

Solving equation (1) by successive approximations, we obtain:

$$\begin{aligned} \bar{x}_1 &= B\bar{x}_0 + \bar{b}, \\ \bar{x}_2 &= B^2\bar{x}_0 + (E + B)\bar{b}, \\ &\dots \\ \bar{x}_n &= B^n\bar{x}_0 + (E + B + B^2 + \dots + B^{n-1})\bar{b}. \end{aligned} \quad (3)$$

Transform the expression

$$\begin{aligned} U_n &= E + B + B^2 + \dots + B^{n-1}, \\ U_n &= (E + B) + B^2(E + B) + B^4(E + B) + \dots + B^{n-2}(E + B) = \\ &= (E + B^2 + B^4 + \dots + B^{n-2})(E + B) = \\ &= ((E + B^2) + B^4(E + B^2) + \dots + B^{n-4}(E + B^2))(E + B) = \\ &= (E + B^4 + B^8 + \dots + B^{n-4})(E + B^2)(E + B). \end{aligned} \quad (4)$$

Continuing the process, we obtain

$$U_n = (E + B^{2^{s-2}})(E + B^{2^{s-3}}) \dots (E + B^2)(E + B). \quad (5)$$

Of course, in this case

$$n = 2^{s-1}. \quad (6)$$

Using relations (3), we obtain

$$\begin{aligned} \bar{x}_{2^{s-1}} &= B^{2^{(s-1)}} \bar{x}_0 + (E + B^{2^{s-2}})(E + B^{2^{s-3}}) \dots (E + B^4)(E + B^2)(E + B) \bar{b} = \\ &= B^{2^{s-1}} \bar{x}_0 + U_{2^{s-1}} \bar{b}. \end{aligned} \quad (7)$$

The sequence of matrices  $U_{2^{s-1}}$  is easily computed, since

$$U_{2^{s-1}} = (E + B^{2^{s-2}}) U_{2^{s-2}}, \quad U_1 = E; \quad (8)$$

$$B^{2^s-1} = (B^{2^{s-2}})^2. \quad (9)$$

The same method gives a way of determining the inverse matrix

$$G = (E - B)^{-1},$$

$$G_{2^{s-1}} = B^{2^s-1} G_0 + U_{2^{s-1}}.$$

It should be noted that the method can also be applied to functional equations, provided it is possible to construct an effective process for computing the operators  $B^{2^s-1}$  and  $U_{2^{s-1}}$ .
