ON THE THEORY OF INCOMPLETE MACDONALD FUNCTIONS

(Presented by Academician E. K. Fedorov on 6 VII 1964)

The functions

$$B_m(x, z) = \frac{1}{2} \int_x^\infty \xi^{m-1} e^{-\frac{1}{2}z(\xi + \frac{1}{\xi})} d\xi, \quad (1a)$$

$$K_m(x, z) = \frac{1}{2} \int_0^x \xi^{m-1} e^{-\frac{1}{2}z(\xi + \frac{1}{\xi})} d\xi \quad (1)$$

we call **incomplete Macdonald functions**.

The functions $B_m(x, z)$ and $K_m(x, z)$ occur in the solution of partial differential equations of parabolic type, for example, the stationary equation of turbulent diffusion of a radioactive impurity in the atmosphere with allowance for wind transport ($u_z = \text{const}$) from local sources. Then, when the coefficient of turbulence varies with height ($k_z = k_0 z^n$; $0 \geq n \geq 1$), the concentration $q(x, z) = A(z)K_m(x, z)$.

The function $K_m(x, z)$ also occurs in calculations of the interaction effect of gamma quanta with the scintillator material. In the latter case the recorded signal $g(E, E_0)$, where E is the signal amplitude, has the form of a Gaussian curve with variance proportional to the energy of the incident quanta E_0 . If the spectrum $\omega(E_0)$ of the incident radiation is continuous, then the resulting effect is

$$g(E, E_1) = 2 \sum_{m=1}^{\infty} a_{m-1} E^{-m} e^{\beta E} K_m(E_1, \beta E).$$

Here a_{m-1} are the coefficients of the Taylor-series expansion of the product $\omega(E_0)\rho(E_0)$, where $\rho(E_0)$ denotes the detector efficiency; β is a constant coefficient depending on the resolving power of the spectrometer.

One could also indicate a number of other applications of incomplete Macdonald functions.

It is easy to show that

$$K_m(x, z) = B_{-m} \left(\frac{1}{x}, z \right). \quad (2)$$

Let us integrate (1) by parts; then we obtain the following recurrence formulas for the functions $B_m(x, z)$ and $K_m(x, z)$:

$$B_{m+1}(x, z) = \frac{2m}{z} B_m(x, z) + B_{m-1}(x, z) + \frac{x^m}{z} e^{-\frac{1}{2}z(x+\frac{1}{x})}, \quad (3a)$$

$$K_{m+1}(x, z) = \frac{2m}{z} K_m(x, z) + K_{m-1}(x, z) - \frac{x^m}{z} e^{-\frac{1}{2}z(x+\frac{1}{x})}. \quad (3)$$

Formulas (3) are valid for an arbitrary number m . In the particular case, from formula (3a) as $x \rightarrow 0$ and from formula (3) as $x \rightarrow \infty$, the known recurrence formula for Macdonald functions is obtained. The same recurrence formula is obtained from the sum of formulas (3a) and (3).

1. Consider the function $B_m(x, z)$ of arbitrary order. We introduce the concept of an integro-exponential function with negative index

$$E_{-m}(x) = \int_0^\infty u^m e^{-xu} du. \quad (4)$$

It is easy to show that

$$E_{-m}(x) = \frac{1}{x^{m+1}} \Gamma(m+1, x),$$

where

$$\Gamma(m, x) = \Gamma(m) - \int_0^x u^{m-1} e^{-u} du = \Gamma(m) - \gamma(m, x).$$

Here $\Gamma(m)$ is the gamma function; $\gamma(m, x)$ is the tabulated incomplete gamma function ¹. If in (1) we put $\xi = xt$, then

$$B_{m+1}(x, z) = \frac{x^{m+1}}{2} \int_0^\infty t^m e^{-at} \sum_{p=1}^\infty \frac{1}{p!} \left(\frac{b}{t} \right)^p dt \quad (5)$$

$$\left(a = -\frac{1}{2}xz; \quad b = -\frac{1}{2} \cdot \frac{z}{x} \right).$$

Integration of (5) for arbitrary m gives

$$B_{m+1}(x, z) = \frac{x^{m+1}}{2} \sum_{k=0}^{\infty} \frac{1}{k!} b^k E_{k-m}(a), \quad (6)$$

where

$$E_m(x) = \int_1^{\infty} u^{-m} e^{xu} du$$

is the tabulated integro-exponential function ². For $m < 0$

$$B_{-m}(x, z) = \frac{x^m}{2} \sum_{k=0}^{\infty} \frac{1}{k!} b^k E_{k+m+1}(a). \quad (7)$$

From formulas (2) and (7) one easily obtains the following expression for the function $K_m(x, z)$ for $m > 0$:

$$K_m(x, z) = \frac{x^m}{2} \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} a^k E_{k+m+1}(-b). \quad (8)$$

2. For positive integer m , using expression (5), one can obtain the following formula for computing the function $B_m(x, z)$:

$$B_{m+1}(x, z) = \frac{x^{m+1}}{2} \left\{ m! \frac{e^{-a}}{a} \left[\frac{1}{m!} + \frac{1}{(m-1)!} \left(\frac{1}{a} + \frac{b}{m} \right) + \frac{1}{(m-2)!} \left(\frac{1}{a^2} + \frac{b}{am} + \frac{b^2}{2! m(m-1)} \right) + \dots \right. \right. \\ \left. \left. + \frac{1}{2!} \left(\frac{1}{a^{m-2}} + \frac{b}{ma^{m-3}} + \dots + \frac{b^{m-2}}{(m-2)! m! / 2} \right) + \frac{1}{1!} \left(\frac{1}{a^{m-1}} + \frac{b}{ma^{m-2}} + \dots + \frac{b^{m-1}}{(m-1)! m!} \right) + \left. \left(\frac{1}{a^m} + \frac{b}{ma^{m-1}} + \dots + \frac{b^m}{(m!)^2} \right) \right] + \sum_{m=1}^{\infty} \frac{t^k}{k!} E_{k-m}(a) \right\}. \quad (9)$$

The series (6), (7), (8), and (9) converge for any values of x and z , owing to the fact that

$$E_n(y) > E_{n+1}(y).$$
