**ONE-DIMENSIONAL SINGULAR EQUATIONS IN GENERALIZED FUNCTIONS**

*(Presented by Academician V. I. Smirnov, 1 II 1965)*

Consider the equation

$$a(\tau)f(\tau) + \frac{b(\tau)}{\pi i} \int_L \frac{f(t)}{t - \tau} dt = g(\tau), \quad (1)$$

where  $a(\tau)$ ,  $b(\tau)$ , and  $g(\tau)$  are known functions belonging to the basic\* space  $\Phi$ ;  $L$  is a closed sufficiently smooth contour. The question of the existence of solutions of equation (1) belonging to the space  $\Phi$  was solved <sup>(1)</sup> under the assumption that  $a^2(\tau) - b^2(\tau) \neq 0$  on  $L$ . Some results in this direction were obtained <sup>(2)</sup> also under the assumption that either condition I or condition II is satisfied.

**Condition I.** The quantity  $\Delta_1(\tau) = a(\tau) - b(\tau)$  vanishes at the point  $\alpha \in L$ , while  $\Delta_2(\tau) = a(\tau) + b(\tau)$  vanishes nowhere on  $L$ .

**Condition II.** The quantity  $\Delta_2(\tau)$  vanishes at the point  $\alpha \in L$ , while  $\Delta_1(\tau)$  does not vanish on  $L$ .

Both in condition I and in condition II it is assumed that  $b(\tau) \neq 0$  on  $L$  and that  $\alpha$  is the only root, of integral multiplicity  $m$ , of the corresponding function.

The purpose of the present paper is to investigate the question of the existence of solutions of equation (1) belonging to the space  $\Phi'$ , conjugate to  $\Phi$ , as well as certain properties of these solutions.

1. Let  $\tilde{\Phi}$  be a countably normed space of functions infinitely differentiable on  $L$ , where  $L$  is a closed infinitely differentiable contour, and let the system of norms be introduced as follows:

$$\|\varphi\|_p = \max_{t \in L} \{|\varphi(t)|, |\varphi'(t)|, \dots, |\varphi^{(p)}(t)|\} \quad (p = 1, 2, \dots).$$

Let, in the singular equation (1),  $a(\tau)$ ,  $b(\tau)$ ,  $g(\tau) \in \tilde{\Phi}$  and  $a^2(\tau) - b^2(\tau) \neq 0$  on  $L$ . Using the results of <sup>(1)</sup>, one can show that the solutions of equation (1) fall into this same space  $\tilde{\Phi}$ ; the Cauchy operator maps  $\tilde{\Phi}$  into itself, and in this space

Noether's theorems are valid. In the case when the coefficients of equation (1) satisfy one of conditions I or II, using the results of (2), one can also show that the solutions of equation (1) belong to the space  $\tilde{\Phi}$ .

2. Let us now consider the equation

$$a(\tau)f + \frac{b(\tau)}{\pi i} \int_L \frac{f}{t - \tau} dt = 0, \quad (2)$$

where  $a(\tau)$  and  $b(\tau)$  are functions belonging to a certain countably normed space  $\Phi$ ;  $L$  is a closed contour such that the Cauchy operator maps  $\Phi$  into itself;  $f$  is the unknown functional belonging to the space  $\Phi'$ . In this case, by the expression

$$F = \int_L \frac{f}{t - \tau} dt$$

\* By a basic space we shall mean a normed or countably normed space of functions differentiable a sufficiently large number of times.

we shall mean the functional  $F \in \Phi'$ , defined by the equality

$$(F, \varphi) = \left( f, - \int_L \frac{\varphi(t)}{t - \tau} dt \right) \quad (\varphi(t) \in \Phi).$$

Below all solutions of equation (2) belonging to the space  $\Phi$  will be called classical. Suppose for the time being that  $a^2(\tau) - b^2(\tau) \neq 0$  on  $L$  and that Noether's theorems are valid in the space  $\Phi$ .

**Theorem 1.** *Equation (2) has only classical solutions belonging to the space  $\Phi'$ .*

3. Let us now consider equation (1) under the assumption that  $g \in \Phi'$  and  $a^2(\tau) - b^2(\tau) \neq 0$  on  $L$ . Denote by  $\Phi_0$  the set of all functions  $\varphi_0(t) \in \Phi$  representable in the form

$$\bar{a}(\tau)\varphi(\tau) + \frac{1}{\pi i} \int_L \frac{\bar{b}(t)\varphi(t)}{t - \tau} dt = \varphi_0(\tau); \quad \varphi(t), \varphi_0(t) \in \Phi. \quad (3)$$

It is easy to show that any element of  $\Phi$  can be represented in the form

$$\varphi(t) = \sum_{j=1}^k \varphi_j(t)(\varphi, \varphi^j) + \hat{\varphi}(t), \quad \hat{\varphi}(t) \in \Phi_0,$$

where  $\varphi^j(t)$  ( $j = 1, 2, \dots, k$ ) is a complete system of classical solutions of equation (2), and  $\varphi_j(t) \in \Phi$  are such that  $(\varphi^i, \varphi_j) = \delta_{ij}$  ( $i, j = 1, 2, \dots, k$ ).

**Theorem 2\*.** *In order that equation (1) be solvable in the space  $\Phi'$ , it is necessary and sufficient that the conditions*

$$(g, \tilde{\varphi}^j) = 0, \quad (j = 1, 2, \dots, \tilde{k}), \quad (4)$$

be satisfied, where  $\tilde{\varphi}^j(t)$  ( $j = 1, 2, \dots, \tilde{k}$ ) are solutions of the homogeneous equation adjoint to (2).

Let  $\tilde{\varphi}(t)$  be a solution of the equation

$$\bar{a}(\tau)\tilde{\varphi}(\tau) + \frac{1}{\pi i} \int_L \frac{\bar{b}(t)\tilde{\varphi}(t)}{t - \tau} d\bar{t} = \tilde{\varphi}(\tau)$$

and let conditions (4) be satisfied; then it is easy to show that the functional  $f_0$ , defined by the equality

$$(f_0, \varphi) = (g, \tilde{\varphi}), \quad (5)$$

is a particular solution of equation (1), while the general solution of equation (1) in the space  $\Phi'$  has the form

$$f = f_0 + \sum_{j=1}^k c_j \varphi^j(t).$$

Let a sequence of functionals  $g_n \in \Phi'$  be such that conditions (4) are satisfied for all  $g_n$ , and let  $f_0^n$  be the elements of the space  $\Phi'$  corresponding to  $g_n$  from (5).

**Theorem 3.** *If the sequence  $g_n$  converges strongly (weakly) to  $g$  in the topology of the space  $\Phi'$ , then the sequence  $f_0^n$  also converges strongly (weakly) to  $f_0$  in the topology of the space  $\Phi'$ . If  $p$  is the order of the functional\*\*  $g$ , then the order of the functional  $f_0$  does not exceed  $p$ .*

4. In paper (2) it was shown that both under condition I and under condition II, on the assumption that the given functions belong to the class\*\*\*  $H$ ,

\* For  $\chi \geq 0$  ( $\chi$  is the index of equation (1) in the space  $\Phi$ ), the assertion of the theorem follows easily from T

\*\* For the definition of the order of a functional, see (3).

\*\*\*  $H$  is the class of functions satisfying on  $L$  a Hölder condition with positive exponent.

equation (1) reduces to an equation of Fredholm type

$$f(\tau) + \int_L P(t, \tau) f(t) dt = Ag, \quad (6)$$

where the explicit form of the operator  $A$ —an unbounded regularizer of equation (1)—was written out in (4).

Suppose that  $L$  is a sufficiently smooth contour, and the given functions  $a(\tau)$ ,  $b(\tau)$ , and  $g(\tau)$  have  $m + 1$  continuous derivatives, where  $m$  denotes the multiplicity of the root  $\alpha$  for  $\Delta_1(\tau)$ , and let  $g(\tau)$  be such that the conditions

$$(g, \tilde{\varphi}^j) = 0 \quad (j = 1, 2, \dots, s); \quad (Ag, \tilde{\psi}^i) = 0 \quad (i = 1, 2, \dots, p), \quad (7)$$

are satisfied, where  $\tilde{\varphi}^j(t)$  ( $j = 1, 2, \dots, s$ ) are the classical solutions of the homogeneous equation adjoint to (1), and  $\tilde{\psi}^i(t)$  ( $i = 1, 2, \dots, p$ ) are all the solutions of the homogeneous equation adjoint to (6) that do not belong to  ${}^*D(A^*)$ .

**Theorem 4.** *In order that equation (1) be solvable in the space  $\Phi$ , it is necessary and sufficient that conditions (7) be fulfilled.*

5. Let us now consider equation (2), and suppose that the functions  $a(\tau), b(\tau) \in \Phi$  satisfy the conditions of the preceding item, and that the unknown functional  $f \in \Phi'$ . Let  $\Phi_0$  be the set of functions  $\varphi_0(t) \in \Phi$  representable in the form (3), and let

$$\psi(\tau) + \int_L \tilde{P}(t, \tau) \psi(t) dt = \tilde{A}\psi_0, \quad (8)$$

$$\psi(\tau) = b(\tau) \overline{\varphi(\tau)}, \quad \psi_0(\tau) = b(\tau) \overline{\varphi_0(\tau)}$$

be the Fredholm-type equation obtained from (3) by regularization with the corresponding unbounded operator  $\tilde{A}$ . Define the functionals  $f_i \in \Phi'$  as follows:

$$(\tilde{A}\varphi, \psi_i) = \overline{(f_i, \varphi)} \quad (i = 1, 2, \dots, p),$$

where  $\psi_i(t)$  ( $i = 1, 2, \dots, p$ ) are solutions of the homogeneous equation adjoint to (8), not belonging to  $D(\tilde{A}^*)$ .

**Theorem 5.** *The general solution of equation (2) in the space  $\Phi'$  has the form*

$$f = \sum_{i=1}^p \alpha_i f_i + \sum_{j=1}^s \beta_j \varphi^j(t),$$

$$\varphi^j(t) \quad (j = 1, 2, \dots, s)$$

is a complete system of classical solutions of equation (2); moreover,  $f_i$  ( $i = 1, 2, \dots, p$ ) and  $\varphi^j(t)$  ( $j = 1, 2, \dots, s$ ) are linearly independent.

From this we readily obtain an expression for finding the index  $\varkappa$  of equation (2) in the space  $\Phi'$ :

$$\varkappa = \begin{cases} p, & k \geq 0, \\ p - p_1, & -m \leq k \leq 0, \\ -p_1, & k \leq -m; \end{cases} \quad \varkappa = \begin{cases} p, & k_1 \geq m, \\ p - p_1, & 0 \leq k_1 \leq m, \\ -p_1, & k_1 \leq 0, \end{cases}$$

where the formula on the left applies when  $\Delta_1(\alpha) = 0$ , while  $\Delta_2(\tau) \neq 0$  on  $L$ , and the formula on the right when  $\Delta_2(\alpha) = 0$ , while  $\Delta_1(\tau) \neq 0$  on  $L$ ;  $p$  is the number of classical solutions of the homogeneous equation adjoint to (8), and  $p_1$  is the corresponding number for the equation adjoint to (2), and

$$k = -\frac{1}{2\pi i} \ln \left. \frac{\Delta_2(\tau)}{\Delta_1(\tau)(\tau - \alpha)^{-m}} \right|_L; \quad k_1 = -\frac{1}{2\pi i} \ln \left. \frac{|\Delta_2(\tau)|}{\Delta_1(\tau)(\tau - \alpha)^m} \right|_L.$$

\* It follows from (4) that such  $\tilde{\psi}^i(t)$  ( $i = 1, 2, \dots, p$ ) will be found.

**Theorem 6.** If in equation (1)  $g \in \Phi'$ , and the coefficients satisfy one of conditions I or II, then, for equation (1) to be solvable in the space  $\Phi'$ , it is necessary and sufficient that the conditions

$$(g, \tilde{\varphi}^j) = 0 \quad (j = 1, 2, \dots, s')$$

be satisfied, where  $\tilde{\psi}^i(t)$  are the classical solutions of the equation adjoint to (2). In this case the general solution of equation (1) is given by the formula

$$f = f_0 + \sum_{i=1}^p \alpha_i f_i + \sum_{j=1}^s \beta_j \varphi^j(t).$$

Here the functional  $f_0$  is defined by equality (5).

In conclusion we note that all the results remain valid if  $\Delta_1(\tau)$  or  $\Delta_2(\tau)$  vanish not at one point, but at several points belonging to  $L$ , provided that their number is finite.

I express my gratitude to Prof. S. G. Mikhlin for valuable comments during the preparation of this work.
