**ON THE RESOLVENT OF GENERALIZED SELF-ADJOINT EXTENSIONS OF SYMMETRIC OPERATORS**

*(Presented by Academician L. S. Pontryagin on 3 V 1967)*

In the present note a number of theorems on the resolvent of generalized self-adjoint extensions are considered.

**I.** Consider a triple of spaces  $G_+ \subseteq G_0 \subseteq G_-$ , and let  $B$  be an arbitrary generalized self-adjoint operator acting from  $G_+$  into  $G_-$ . We shall regard it as an operator in the space  $G_-$  with dense domain  $G_+$ . Note that in the space  $G_-$  the operator  $B$  is, generally speaking, nonsymmetric. It is easy to see that all eigenvalues of the operator  $B$  ( $Bf = \lambda f$ ,  $f \in G_+$ ) are real. Denote  $\Delta_B(\lambda) = (B - \lambda I)G_+$ .

**Theorem 1.** *The number  $\lambda$  is an eigenvalue of the generalized self-adjoint operator  $B(G_+ \rightarrow G_-)$  if and only if*

$$\overline{\Delta_B(\bar{\lambda})} \neq G_-.$$

**Proof.** Let  $\lambda$  be an eigenvalue of  $B$ , so that  $Bf = \lambda f$  ( $f \neq 0$ ). In that case, for any  $g \in G_+$ ,

$$\begin{aligned} (J^{-1}f, (B - \lambda I)g)_- &= (f, J(B - \lambda I)g)_+ = \\ &= (f, (B - \lambda I)g)_0 = (Bf - \bar{\lambda}f, g)_0 = 0, \end{aligned}$$

and, consequently, the vector  $J^{-1}f \neq 0$  is orthogonal to  $\Delta_B(\lambda)$ , which is possible only when

$$\overline{\Delta_B(\lambda)} \neq G_-.$$

Now suppose that

$$\overline{\Delta_B(\bar{\lambda})} \neq G_-.$$

In that case there exists a vector  $\alpha \in G_-$  orthogonal to the manifold  $\Delta_B(\lambda)$ . Therefore, for any  $g \in G_+$ ,

$$(\alpha, (B - \lambda I)g)_- = (J\alpha, J(B - \lambda I)g)_+ =$$

$$= (J\alpha, (B - \lambda I)g)_0 = ((B - \bar{\lambda}I)J\alpha, g)_0 = 0.$$

It follows from this that the vector  $f = J\alpha \neq 0$  ( $f \in G_+$ ) is an eigenvector of the operator  $B$ , corresponding to the eigenvalue  $\lambda$  ( $\lambda = \bar{\lambda}$ ). The theorem is proved.

**Corollary.** *If  $\lambda$  is a nonreal number, then*

$$\overline{\Delta_B(\bar{\lambda})} = G_-.$$

**II.** Let  $A$  be a symmetric operator with defect index  $(r, r)$  ( $r < \infty$ ), acting in  $G_0$ . Consider the Hilbert space  $G_+ = D_{A^*}$  with scalar product

$$(f, g)_+ = (A^*f, A^*g)_0 + (f, g)_0 \quad (f, g \in D_{A^*})$$

and construct, as was done in <sup>(1,3)</sup>, a triple of spaces  $G_+ \subseteq G_0 \subseteq G_-$ . In <sup>(5)</sup> it was shown that  $A$  can be extended to  $G_+ = D_{A^*}$  in such a way that the resulting extension  $A_{G_+}$  ( $G_+ \rightarrow G_-$ ) is a generalized self-adjoint operator.

**Theorem 2.** *If  $\lambda$  is a nonreal number and  $A_{G_+}$  is an arbitrary generalized self-adjoint extension of a symmetric operator with defect index  $(r, r)$  ( $r < \infty$ ), then  $R_\lambda = (A_{G_+} - \lambda I)^{-1}$  continuously maps*

maps the Hilbert space  $G_-$  onto the Hilbert space  $G_0$ , and, moreover,

$$\|R_\lambda\| \leq \frac{\sqrt{2}}{\sin \varphi_\lambda} (1 + |\lambda|) \left(1 + \frac{1}{|\operatorname{Im} \lambda|}\right) \quad (\varphi_\lambda \neq 0), \quad (1)$$

where  $\varphi_\lambda$  is the minimal angle between certain subspaces.

We outline the proof of this theorem. Denote

$$\Delta_{A_{G_+}}(\lambda) = (A_{G_+} - \lambda I)G_+.$$

Then, if  $a = (A_{G_+} - \lambda I)f$  ( $f \in G_+$ ,  $a \in G_-$ ), then

$$\|a\|_- \geq |\operatorname{Im} \lambda| \|f\|_0^2 / \|f\|_+. \quad (2)$$

Further,

$$\|a\|_- = \sup_{\varphi \in G_+} \frac{|(\varphi, a)_0|}{\|\varphi\|_+} = \sup_{\varphi \in G_+} \frac{|(\varphi, (A_{G_+} - \lambda I)f)_0|}{\|\varphi\|_+} \geq \sup_{\psi \in D_A} \frac{|((A - \bar{\lambda}I)\psi, f)_0|}{\|A\psi\|_0 + \|\psi\|_0}. \quad (3)$$

It follows that

$$\|a\|_- \geq \sup_{\psi \in D_A} \frac{|((A - \bar{\lambda}I)\psi, f)_0|}{(1 + |\lambda|) \left(1 + \frac{1}{|\operatorname{Im} \lambda|}\right) \|(A - \bar{\lambda}I)\psi\|_0}.$$

Denote

$$\Delta_A(\bar{\lambda}) = (A - \bar{\lambda}I)D_A.$$

Obviously,  $\Delta_A(\bar{\lambda})$  is a subspace in  $G_0$ . Then

$$G_0 = \Delta_A(\bar{\lambda}) + \Delta_A(\lambda)^\perp. \quad (4)$$

As is known,  $\Delta_A(\bar{\lambda}) = \mathfrak{N}_\lambda$ , where  $\mathfrak{N}_\lambda$  is the eigenspace of the operator  $A^*$  corresponding to the eigenvalue  $\lambda$ . From (2) and (3) it follows that

$$\|a\|_- \geq \frac{1}{(1 + |\lambda|)(1 + 1/|\operatorname{Im} \lambda|)} \|Pf\|_0, \quad (5)$$

where  $P$  is the projection operator onto  $\Delta_A(\bar{\lambda})$ . From relations (2), (3), (4), and (5) it follows that

$$\|(A_{G_+} - \lambda I)Pf\|_- \geq \frac{1}{(1 + |\lambda|)(1 + 1/|\operatorname{Im} \lambda|)} \|Pf\|_0; \quad (6)$$

$$\|(A_{G_+} - \lambda I)Qf\|_- \geq \frac{|\operatorname{Im} \lambda|}{\sqrt{|\lambda|^2 + 1}} \|Qf\|_0. \quad (7)$$

Here  $Q$  is the projection operator onto  $\mathfrak{N}_\lambda$ . Denote

$$G_-^{(1)} = (A_{G_+} - \lambda I)Pf, \quad G_-^{(2)} = (A_{G_+} - \lambda I)Qf \quad (f \in G_+).$$

Then from (4)

$$\Delta_{A_{G_+}}(\lambda) = G_-^{(1)} + G_-^{(2)}.$$

Denote by  $\cos \varphi_\lambda$  the cosine of the minimal angle <sup>(2)</sup> between the closures in  $G_-$  of the linear manifolds  $G_-^{(1)}$  and  $G_-^{(2)}$ ; taking into account relations (6) and (7), we obtain

$$\|(A_{G_+} - \lambda I)f\|_-^2 \geq \frac{1 - \cos^2 \varphi_\lambda}{2} \frac{1}{(1 + |\lambda|)^2 \left(1 + \frac{1}{|\operatorname{Im} \lambda|}\right)^2} \|f\|_0^2.$$

Since, by virtue of the corollary to Theorem 1,  $\overline{\Delta_{A_{G_+}}}(\lambda) = G_-$ , relation (1) follows from the last relation.

**Theorem 3.** Every generalized self-adjoint extension  $A_G$  of a symmetric operator  $A$  with defect index  $(r, r)$  ( $r < \infty$ ) does not admit a closure as an operator acting from  $G_0$  into  $G_-$ .\*

\* Consequently, a fortiori,  $A_{G_+}$  does not admit a closure as an operator acting in  $G_-$  and having dense domain of definition  $G_+$ .

**Proof.** We shall show that there exists a sequence  $f_n$  ( $f_n \in G_+$ ,  $n = 1, 2, \dots$ ), converging to zero in the metric  $G_0$ , and such that  $A_{G_+}f_n$  converges in the metric  $G_-$ , with

$$\lim_{n \rightarrow \infty} A_{G_+}f_n \neq 0.$$

In (5) it was shown that every generalized self-adjoint extension  $A_{G_+}$  of the operator  $A$  has the form

$$A_{G_+}f = A^*f + \sum_{k,j=1}^r [a_{jk}(f, \hat{e}_j)_0 + b_{jk}(f, \hat{q}_j)_0] \hat{g}_k + \sum_{k,j=1}^r [c_{jk}(f, \hat{e}_j)_0 + d_{jk}(f \hat{g}_j)_0] \hat{e}_k,$$

where the coefficient matrices satisfy the relations

$$D = A^*, \quad c_{kj} = \bar{c}_{jk}, \quad b_{kj} = \bar{b}_{jk} \quad (k \neq j),$$

$$\operatorname{Im} c_{jj} = -\frac{1}{2}, \quad \operatorname{Im} b_{jj} = \frac{1}{2}.$$

Let

$$f_n = f_A^{(n)} + e_j,$$

where, in the metric  $G_0$ ,

$$f_A^{(n)} \rightarrow (-e_j), \quad f_A^{(n)} \in D_A$$

and

$$e_j \in \mathfrak{N}_i, \quad e_j = J\hat{e}_j$$

(see (5)). Thus  $f_n \rightarrow 0$  in the metric  $G_0$ . It can be shown that

$$\alpha_n = A_{G_+}f_n$$

will converge in the metric  $G_-$ .

Further,

$$(\alpha_n, g)_0 = (f_A^{(n)}, A^*g)_0 = i(e_j, g)_0 + \sum_{k=1}^r a_{jk}(\hat{g}_k, g)_0 + \sum_{k=1}^r c_{jk}(\hat{e}_k, g)_0.$$

Let

$$\alpha = \lim_{n \rightarrow \infty} \alpha_n.$$

Then

$$(\alpha, g)_0 = i(e_j, g)_0 - (e_j, A_g^*g)_0 + \sum_{k=1}^r a_{jk}(\hat{g}_k, g)_0 + \sum_{k=1}^r c_{jk}(\hat{e}_k, g)_0.$$

Analyzing the last relation, one can establish,\* that

$$\|\alpha\|_- = \sup_{\|g\|_+ \leq 1} |(\alpha, g)_0| \neq 0.$$

Thus, we have indicated a sequence  $f_n \in G_+$  which tends to zero in the metric  $G_0$ , while  $\alpha_n = A_{G_+} f_n$  does not tend to zero in the metric  $G_-$ .

**Theorem 4\*.** Let  $\tilde{A}$  be a self-adjoint extension of a symmetric operator  $A$ , and let  $A_{G_+}$  be a generalized self-adjoint extension of the operator  $A$  which is also an extension of  $\tilde{A}$ . Then, if  $\lambda$  is a regular point for  $\tilde{A}$ , then

$$R_\lambda = (A_{G_+} - \lambda I)^{-1}$$

maps  $G_-$  continuously into  $G_0$ .

We outline the proof of this theorem. Denote

$$\begin{aligned} \|\alpha\| &= \sup \frac{|(\varphi, (A_{G_+} - \lambda I)f)_0|}{\|\varphi\|_+} \geq \sup_{\psi \in D_{\tilde{A}}} \frac{|((\tilde{A} - \bar{\lambda}I)\psi, f)_0|}{\|\tilde{A}\psi\|_0 + \|\psi\|_0} \geq \\ &\geq \sup_{\psi \in D_{\tilde{A}}} \frac{|((\tilde{A} - \bar{\lambda}I)\psi, f)_0|}{(1 + |\lambda|)(1 + \|(\tilde{A} - \bar{\lambda}I)^{-1}\|_0)\|(\tilde{A} - \bar{\lambda}I)\psi\|_0} = \\ &= \frac{1}{(1 + |\lambda|)(1 + \|(\tilde{A} - \bar{\lambda}I)^{-1}\|_0)} \|f\|_0. \end{aligned}$$

\* In this theorem it is not required that the operator  $A$  have finite defect numbers.

It can be shown that if  $f$  is an arbitrary vector from  $G_0$ , then in the range of values of  $(A_{G_+} - \lambda I)$  there exists a sequence  $\alpha_n$ , convergent in  $G_-$ , for which  $(A_{G_+} - \lambda I)^{-1}\alpha_n \rightarrow f$  in the metric of  $G_0$ . Hence, and from the indicated inequalities, the assertion of the theorem follows.

Let us note, in conclusion, that theorems analogous to Theorems 2 and 3 can also be obtained for operators with unequal deficiency indices.
