## The Occurrence of Discontinuities in the Continuation of Solutions of Nonlinear Mixed Problems for Hyperbolic Equations in the Plane

(Presented by Academician I. G. Petrovsky, March 6, 1968)

1°. In the strip  $0 \leq x \leq 1$ ,  $0 \leq t < +\infty$  consider the mixed problem

$$u_{xx} - u_{tt} = A(x, t, u)u_x + B(x, t, u)u_t + F(x, t, u), \quad (1)$$

$$u(x, 0) = \varphi(x), \quad u_t(x, 0) = \psi(x) \quad \text{for } 0 \leq x \leq 1, \quad (2)$$

$$a_0(u)u_x + b_0(u)u_t = f_0(t, u) \quad \text{for } x = 0, \quad (3)$$

$$a_1(u)u_x + b_1(u)u_t = f_1(t, u) \quad \text{for } x = 1. \quad (4)$$

It is known <sup>(1,2)</sup> that if the function  $\dot{u} \in C_2(\bar{\Pi}_{T_0})$  is a solution of problem (1)–(4) in the rectangle

$$\bar{\Pi}_{T_0} = \{0 \leq x \leq 1, 0 \leq t \leq T_0\}, \quad 0 < T_0 < +\infty,$$

and

$$h_i(\dot{u}(i, T_0)) \equiv b_i(\dot{u}(i, T_0)) + (-1)^{i+1}a_i(\dot{u}(i, T_0)) \neq 0 \quad (i = 0, 1), \quad (5)$$

then the solution  $u$  is continued uniquely into  $\bar{\Pi}_{T_0+\Delta T}$  ( $\Delta T > 0$ ) with preservation of smoothness. Below, problem (1)–(4) is studied in the case when, under continuation of a solution of class  $C_2$ , inequality (5) for  $i = 0$  turns into an equality at some time  $t = T^*$ ,  $0 < T^* < 1/2$ .<sup>\*</sup> The violation of inequality (5) is connected with the occurrence of discontinuous oscillations in a telegraph line, first studied by A. A. Vitt <sup>(4)</sup>.

In the present paper a definition is introduced and theorems of existence and uniqueness of a discontinuous solution (d.s.) of problem (1)–(4) for  $t > T^*$

are formulated. Theorem 5 (see 4°) shows that the d.s. of problem (1)–(4) arises in a natural way if one studies the behavior, as  $\mu \rightarrow 0$ , of the solutions of mixed problems obtained by perturbing the operator  $a_0(\dot{u})u_x + b_0(u)u_t$  by the term  $\mu u_{tt}$  ( $\mu > 0$ ). The necessity of introducing a d.s. for  $t > T^*$  is caused by the following circumstance. Consider problem (1)–(4) in  $\Pi_{1/2}$ . Passing, by the substitution  $v = u_x + u_t$ ,  $w = u_x - u_t$ , to the mixed problem for the corresponding hyperbolic system and integrating it along characteristics, one can obtain an integral equation for the function  $u(x, t)$ , equivalent to problem (1)–(4). Such an equation leads to the natural definition of the concept of a continuous generalized solution (c.g.s.) of problem (1)–(4) in  $\bar{\Pi}_T$ ,  $0 < T \leq 1/2$ . In this case  $u$  turns out to be the unique c.g.s. of problem (1)–(4) in  $\bar{\Pi}_{T^*}$ . However, in the “general” case studied here,\*\* for any  $\Delta T > 0$  there is no c.g.s. of problem (1)–(4) in  $\bar{\Pi}_{T^*+\Delta T}$ , and any increase in the smoothness and compatibility of the data of the problem (the functions  $A, B, F, a_i, b_i, f_i, \varphi, \psi$ ) does not lead to the existence of a continuous solution for  $t > T^*$ .

Under the assumption  $A = B = 0$ , a d.s. was considered by us in (3).

**2°. Statement of the problem. Smoothness of the function  $\dot{u}$  in  $\bar{\Pi}_{T^*}$ .**

1. Put  $R_1 = (-\infty, +\infty)$ ,  $D_0 = \Pi_{1/2} \times R_1$ ,  $D_1 = [0, 1/2] \times R_1$ ,  $h_i = b_i + (-1)^{i+1}a_i$ . Let:

---

\* The inequality  $0 < T^* < 1/2$  involves no loss of generality.

\*\* We have in mind the restrictions on the function  $h_0$  given in 2°, and inequality (10).

- 1)  $A, B \in C_2(D_0)$ ,  $F \in C_1(D_0)$ ,  $f_i \in C_1(D_1)$ ,  $a_i, b_i \in C_1(R_1)$ ,  $\varphi \in C_2[0, 1]$ ,  $\psi \in C_1[0, 1]$ ;
- 2)  $h_0$  has only isolated and simple zeros on  $R_1$ ;
- 3)  $h_1$  has no zeros on  $R_1$ .

Let, in the rectangle  $\Pi_{T^*} = \{0 \leq x \leq 1, 0 \leq t < T^*\}$ , there exist a solution  $\dot{u} \in C_2(\Pi_{T^*})$  of problem (1)–(4), and

$$1) \sup_{\Pi_{T^*}} |\dot{u}| < +\infty; \tag{6}$$

- 2)  $h_0(\dot{u}(0, t)) \neq 0$  for  $0 \leq t < T^*$ ; without loss of generality we shall assume that

$$h_0(\dot{u}(0, t)) > 0 \quad \text{for } 0 \leq t < T^*; \tag{7}$$

$$3) \inf_{0 \leq t < T^*} h_0(\dot{u}(0, t)) = 0. \tag{8}$$

Inequality (6) means that the “graph of the function  $\dot{u}$ ” for  $(x, t) \in \Pi_{T^*}$  belongs to the domain of definition of the coefficients and free terms of equations (1), (3), (4); however, equality (8) excludes the possibility of applying, for  $t \leq T^*$ , the uniqueness and continuation theorems for a solution with preservation of smoothness\*, established in (2).

**Lemma 1.** There exists

$$\lim_{t \rightarrow T^*} \dot{u}(0, t) = u^* \quad (9)$$

and  $h_0(u^*) = 0$ .

By virtue of Lemma 1 and inequality (7), either  $\dot{u}(0, t) < u^*$  or  $\dot{u}(0, t) > u^*$  for  $0 \leq t < T^*$ . Without loss of generality we shall assume that  $\dot{u}(0, t) < u^*$ .

2. For  $(x, t) \in \Pi_{T^*}$  put  $\dot{v} = \dot{u}_x + \dot{u}_t$ .

**Lemma 2.** The functions  $\dot{u}, \dot{v} \in C(\overline{\Pi_{T^*}})^{**}$ .

Let

$$\Gamma^0 = f_0(T^*, u^*) - a_0(u^*)\dot{v}(0, T^*) \neq 0. \quad (10)$$

Denote by  $\overline{\Pi_{T^*}}'$  the rectangle  $\overline{\Pi_{T^*}}$  with the point  $(0, T^*)$  “punctured.”

**Theorem 1.** The function  $\dot{u} \in C_2(\overline{\Pi_{T^*}}')$  and

$$|\dot{u}_x(x, t)| \rightarrow +\infty, \quad |\dot{u}_t(x, t)| \rightarrow +\infty, \quad \text{if } t - (x + T^*) \rightarrow 0,$$

$$\sup_{\overline{\Pi_{T^*}}'} |\dot{u}_x(x, t)| \sqrt{|t - (x + T^*)|} < +\infty,$$

$$\sup_{\overline{\Pi_{T^*}}'} |\dot{u}_t(x, t)| \sqrt{|t - (x + T^*)|} < +\infty.$$

The properties of the derivatives  $\dot{u}_x, \dot{u}_t$  stated in Theorem 1 are determined by the properties of the function  $h_0$ , and not by the smoothness and compatibility of the data of problem (1)–(4). Theorem 1 holds even in the case of analytic and arbitrarily well compatible data.

**3°. Discontinuous solution of problem (1)–(4).**

1. For  $T^* < T \leq \frac{1}{2}$  put  $K_T^1 = \{0 \leq x \leq t - T^*, T^* \leq t \leq T\}$ ,  $K_T^0 = \overline{\Pi_T} \setminus K_T^1$ . Let  $\mathfrak{A}_T$ ,  $T^* < T \leq \frac{1}{2}$ , be the set of functions  $u(x, t)$  such that  $u = \dot{u}$  in  $\Pi_{T^*}$ ,  $u \in C(K_T^0)$ ,  $u \in C_2(K_T^0)$ , and

$$\sup_{K_T^0} |u_x(x, t)| \sqrt{|t - (x + T^*)|} < +\infty,$$

$$\sup_{K_T^0} |u_t(x, t)| \sqrt{|t - (x + T^*)|} < +\infty.$$

\* It can be shown that if  $\inf_{0 \leq t < T^*} h_0(\dot{u}(0, t)) \neq 0$ , then in  $\bar{\Pi}_{T^* + \Delta T}$ , for some  $\Delta T > 0$ , there exists a unique solution of problem (1)–(4) of class  $C_2(\bar{\Pi}_{T^* + \Delta T})$ .

\*\* That is, the functions  $\dot{u}, \dot{v}$  admit a continuous extension as  $t \rightarrow T^*$ .

**Definition 1.** A function  $u \in \mathfrak{R}_T$ ,  $T^* < T \leq 1/2$ , is called a **solution of problem (1)–(4) in  $K_T^0$**  if  $u$  satisfies equation (1) in  $K_T^0$  and equation (4) for  $T^* \leq t \leq T$ .

**Lemma 3.** The following alternative holds:

A. The solution  $u$  of problem (1)–(4) exists and is unique in  $K_{1/2}^0$ .

B. There exists a  $T^* < T_0 \leq 1/2$  such that the solution  $u$  exists and is unique in  $K_{T_0 - \varepsilon}^0$  for any  $\varepsilon > 0$ , and

$$\max_{K_{T_0 - \varepsilon}^0} |\ddot{u}| + \sup_{K_{T_0 - \varepsilon}^0} |\ddot{u}_x(x, t)| \sqrt{|t - (x + T^*)|} + \sup_{K_{T_0 - \varepsilon}^0} |\ddot{u}_t(x, t)| \sqrt{|t - (x + T^*)|} \rightarrow +\infty \quad \text{as } \varepsilon \rightarrow 0.$$

Put  $T_1 = 1/2$  in case A and  $T_1 = T_0 - \varepsilon_0$ , where  $0 < \varepsilon_0 < T_0$  is any fixed number, in case B.

**Lemma 4.** The function  $\check{v} = \check{u}_x + \check{u}_t \in C(\check{K}_{T_1}^0)$ .

Below the functions  $\check{u}, \check{v}$  are denoted as before by  $\dot{u}, \dot{v}$ .

2. Let

$$H_0(u) = \int_{\varphi(0)}^u h_0(\xi) d\xi, \quad I^* = \int_0^{T^*} [f_0(\tau, \dot{u}(0, \tau)) - a_0(\dot{u}(0, \tau))\dot{u}(0, \tau)] d\tau.$$

**Lemma 5.** The value  $u = \bar{u}^*$  is a root of the equation

$$H_0(u) = I^*. \tag{11}$$

Suppose that equation (11) has a real root  $u^* < \bar{u}^* < +\infty$  such that

$$h_0(\bar{u}^*) > 0; \quad H_0(u) \neq I^* \quad \text{for } u^* < u < \bar{u}^*.$$

Denote by  $\mathfrak{R}_T$ ,  $T^* < T \leq T_1$ , the set of functions  $u \in C_2(K_T^1)$  satisfying the condition  $u(0, T^*) = \bar{u}^*$ .

**Definition 2.** A function  $u \in \mathfrak{R}_T$ ,  $T^* < T \leq T_1$ , is called a **solution of problem (1)–(4) in  $K_T^1$**  if:

- 1)  $u$  satisfies equation (1) in  $K_T^1$  and equation (3') for  $T^* \leq t \leq T$ ;
- 2) for  $T^* \leq t \leq T$  the relations

$$h_0(u(0, t)) > 0,$$

$$\begin{aligned} v(t - T^*, t) - P(t - T^*, t, u(t - T^*, t)) = \\ = \dot{v}(t - T^*, t) - P(t - T^*, t, \dot{u}(t - T^*, t)), \end{aligned}$$

hold, where

$$v = u_x + u_t, \quad P(x, t, u) = \frac{1}{2} \int_0^u [A(x, t, \eta) - B(x, t, \eta)] d\eta.$$

Let the function  $u \in \mathfrak{R}_T$ ,  $T^* < T \leq T_1$ , be a solution of problem (1)–(4) in  $K_T^1$ .

**Definition 3.** The function  $u_p = u$ , if  $(x, t) \in K_T^1$ , and  $u_p = \dot{u}$ , if  $(x, t) \in K_T^0$ , is called an r.r. solution of problem (1)–(4) in  $\Pi_T$ .

**Theorem 2.** The following alternative holds:

- 1) in  $K_{T_1}^1$  there exists a unique solution  $u$  of problem (1)–(4), and

$$h_0(u(0, t)) > 0 \quad \text{for } T^* \leq t \leq T_1;$$

- 2) there exists a  $T^* < \tilde{T} \leq T_1$  such that for any  $\varepsilon > 0$  in  $K_{\tilde{T}-}^1$  there exists a unique solution  $u$  of problem (1)–(4), and

$$h_0(u(0, t)) > 0 \quad \text{for } T^* \leq$$

$\leq t \leq \tilde{T} - \varepsilon$ ; moreover:

- a) either

$$\sup_{\substack{T^* \leq t < \tilde{T} \\ 0 \leq x \leq t - T^*}} |u| < +\infty$$

and there exists

$$\lim_{t \rightarrow \tilde{T}} u(0, t) = u^{**}, \quad h_0(u^{**}) = 0;$$

b) or

$$\sup_{\substack{T^* \leq t < \tilde{T} \\ 0 \leq x \leq t - T^*}} |u| = +\infty.$$

It is not difficult to construct examples showing that all the cases indicated in Theorem 2 are in fact realized.

Put  $T_2 = T_1$  in case 1) of Theorem 2, and  $T_2 = \tilde{T} - \varepsilon_0$ , where  $0 < \varepsilon_0 < \tilde{T}$  is any fixed number, in case 2).

**Theorem 3.** In  $\bar{\Pi}_{T_2}$  there exists a unique d.r.  $u_p$  of problem (1)–(4), and for  $T^* \leq t \leq T_2$

$$u(t - T^*, t) - \dot{u}(t - T^*, t) = \bar{u}^* - u^* + \int_{T^*}^t [P(\tau - T^*, \tau, u(\tau - T^*, \tau)) - P(\tau - T^*, \tau, \dot{u}(\tau - T^*, \tau))] d\tau.$$

#### 4°. Small perturbations of equation (3) and a discontinuous solution.

Following A. A. Vitt <sup>(4)</sup>, consider in  $\bar{\Pi}_{T_2}$  the mixed problem (1')–(4'), defined by equations (1), (2), (4) and the boundary condition

$$\mu u_{tt} + a_c(u)u_x + b_0(u)u_t = f_0(t, u) \quad \text{for } x = 0. \quad (3')$$

We note that the functions  $\varphi, \psi$ , generally speaking, do not satisfy the compatibility condition of problem (1')–(4') for  $x = 0$ . Consequently, for any  $T > 0$  in  $\bar{\Pi}_T$  there is no solution of problem (1')–(4') of class  $C_2(\Pi_T)$ .

For  $0 < T \leq T_2$  put  $G_T^0 = \{(x, t), 0 \leq x \leq T\}$ ,  $G_T^1 = \bar{\Pi}_T \setminus G_T^0$ . We now introduce the following

**Definition 4.** A function  $u_\mu(x, t)$  is called a solution of problem (1')–(4') in  $\bar{\Pi}_T$ ,  $0 < T \leq T_2$ , if  $u_\mu \in C_1(\bar{\Pi}_T)$ ,  $u_\mu \in C_2(\bar{G}_T^i)$  ( $i = 0, 1$ ), and  $u_\mu$  satisfies equation (1) in the domains  $\bar{G}_T^i$  and equations (2), (3'), (4) for  $0 \leq x \leq 1$ ,  $0 \leq t \leq T$ .

**Theorem 4.** One can specify a  $\mu^* > 0$  such that, for  $0 < \mu < \mu^*$ , in  $\bar{\Pi}_{T_2}$  there exists a unique solution  $u_\mu$  of problem (1')–(4'), and

$$\max_{\bar{\Pi}_{T_2}} |u_\mu| < C < +\infty$$

for  $0 < \mu < \mu^*$ , where  $C$  is a constant independent of  $\mu$ .

**Theorem 5.** Whatever closed domain  $\Omega \subseteq \bar{\Pi}_{T_2}$  not having a common point with the characteristic  $t = x + T^*$  may be,

$$\max_{\Omega} |u_\mu - u_p| + \max_{\Omega} |\partial u_\mu / \partial x - \partial u_p / \partial x| + \max_{\Omega} |\partial u_\mu / \partial t - \partial u_p / \partial t| \rightarrow 0$$

as  $\mu \rightarrow 0$ .
