## ON BICOMPACT SEMIREGULAR AND HAUSDORFF EXTENSIONS

(Presented by Academician P. S. Aleksandrov, 4 I 1968)

The purpose of this paper is to obtain all semiregular ( $= T_b$ )-bicomcompact extensions of  $T_\lambda$ -spaces  $*$  (Theorem 1) and all Hausdorff bicomcompact extensions of Tikhonov ( $=$  completely regular) spaces (Theorem 2) in the form of limits of certain projection spectra, namely spectra that are so-called refinements (maximal finite ones) of the spectrum  $S_X$  of the given space  $X$ .

**Definition 1.** A projection spectrum  $S^* = \{K_\alpha^*, \mathfrak{F}_\alpha^{\alpha'}\}$  is called a **refinement** of the spectrum  $S = \{K_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$  if both spectra are directed by one and the same set of indices  $\{\alpha\}$ , and for each  $\alpha$  a one-to-one mapping  $f_\alpha$  is given from the set  $\dot{K}_\alpha$  of all vertices of the complex  $K_\alpha$  onto the set  $\dot{K}_\alpha^*$  of all vertices of the complex  $K_\alpha^*$ , inducing a simplicial mapping  $f_\alpha$  of the complex  $K_\alpha$  into the complex  $K_\alpha^*$ , commuting with the projections in the sense that, for  $\alpha' \geq \alpha$ , we have

$$f_\alpha \mathfrak{F}_\alpha^{\alpha'} = \mathfrak{F}_\alpha^{*\alpha'} f_{\alpha'};$$

if, moreover, for all  $\alpha$  one has  $f_\alpha K_\alpha = K_\alpha^*$ , then the spectra  $S$  and  $S^*$  are isomorphic to one another.

**Remark 1.** Let the spectrum  $S^* = \{K_\alpha^*, \mathfrak{F}_\alpha^{*\alpha'}\}$  be a refinement of the spectrum  $S = \{K_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$ . Identify each vertex  $e_\alpha$  of the complex  $K_\alpha$  with the corresponding vertex  $f_\alpha e_\alpha$  of the complex  $K_\alpha^*$ ; then the complexes  $K_\alpha$  and  $K_\alpha^*$  have one and the same set of vertices, hence  $K_\alpha \subseteq K_\alpha^*$  and  $\mathfrak{F}_\alpha^{*\alpha'} = \mathfrak{F}_\alpha^{\alpha'}$ .

Let the spectrum  $S^{(1)} = \{K_\alpha^{(1)}, \mathfrak{F}_\alpha^{\alpha'}\}$  be a refinement of the spectrum  $S^{(2)} = \{K_\alpha^{(2)}, \mathfrak{F}_\alpha^{\alpha'}\}$ . Then every maximal thread of the spectrum  $S^{(2)}$  is a thread of the spectrum  $S^{(1)}$ ; if it is also maximal in the spectrum  $S^{(1)}$ , then we call it **invariant under the refinement**  $S^{(1)}$  of the spectrum  $S^{(2)}$ .

Let  $S_X = \{N_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$  be the spectrum of the  $T_\lambda$ -space  $X$ . If  $x \in X$ , then by  $t_\alpha(x)$  we denote the simplex of the nerve  $N_\alpha$  whose support corresponds to the set of all elements of the covering  $\alpha$  containing the point  $x$ . It is shown that  $\{t_\alpha(x)\}$  is a maximal thread  $\xi(x) = \{t_\alpha(x)\}$  of the spectrum  $S_X$ .

**Definition 2.** A refinement  $S = \{N'_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$  of the spectrum  $S_X = \{N_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$  of a given  $T_\lambda$ -space  $X$  is called **correct** if, under this refinement, every thread of the form  $\xi = \{t_\alpha(x)\}$  of the spectrum  $S_X$  is invariant.

Let  $S^{(1)} = \{K_\alpha^{(1)}, \mathfrak{F}_\alpha^{\alpha'}\}$  and  $S^{(2)} = \{K_\alpha^{(2)}, \mathfrak{F}_\alpha^{\alpha'}\}$  be two refinements of the spectrum  $S = \{K_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$ . We shall say that  $S^{(1)}$  is a natural refinement of the spectrum  $S^{(2)}$  if, for all  $\alpha$ , we have  $K_\alpha^{(2)} \subseteq K_\alpha^{(1)}$ .

**Remark 2.** The set of all correct refinements of the spectrum  $S_X$  is partially ordered:  $S^{(2)}$  follows  $S^{(1)}$  if  $S^{(1)}$  is a natural refinement of the spectrum  $S^{(2)}$ . The set of all bicomact semiregular extensions of a given  $T_\lambda$ -space  $X$  is partially ordered in the usual way: set  $b_2X \geq b_1X$  if there exists a continuous mapping of the space  $b_2X$  onto  $b_1X$  with fixed  $x \in X$ .

\* For terminology and notation see (2). We consider only finite (= consisting of finite complexes) spectra. Every finite spectrum is bounded (= every one of its threads is contained in a maximal thread) (3), and, consequently, complete (1).

2. Let  $S = \{K_\alpha, \mathfrak{F}_\alpha^{\alpha'}\}$  be an arbitrary spectrum and let the simplex  $t_{\alpha_\sigma} \in K_{\alpha_\sigma}$ . Recall that by  $Ot_{\alpha_\sigma}$ , respectively  $\Phi t_{\alpha_\sigma}$ , we denote the set of all maximal threads  $\xi' = \{t'_\alpha\}$  satisfying the condition  $t'_\alpha \leq t_{\alpha_\sigma}$ , respectively  $t'_\alpha \geq t_{\alpha_\sigma}$ . By the definition of the topology in the inverse-limit space  $\tilde{S}$  of the spectrum  $S$ , the sets  $Ot_\alpha$  form an open base of the space  $\tilde{S}$ . We shall call the spectrum  $S$  **symmetric** if the sets  $\Phi t_\alpha$  form a closed base of the space; here it is enough to restrict oneself to the zero-dimensional simplexes  $t_\alpha = e_\alpha$ .

**Remark 3.** If the spectrum  $S_X$  for a given space  $X$  exists, then it is symmetric ([2], Theorem 1).

**Definition 3.** A spectrum  $S$  is called a  $\lambda$ -**strengthening** of the spectrum  $S_X$  of a given  $T_\lambda$ -space  $X$  if it is symmetric and is a correct strengthening of the spectrum  $S_X$ .

**Theorem 1.** *Let  $X$  be an arbitrary  $T_\lambda$ -space. For every bicomact semiregular extension  $\bar{X} = bX$  of the space  $X$ , the spectrum  $S_{\bar{X}}$  is a  $\lambda$ -strengthening of the spectrum  $S_X$ . Conversely, the limit of every  $\lambda$ -strengthening  $S$  of the spectrum  $S_X$  is a bicomact semiregular extension of the space  $X$ .*

The correspondence  $bX \rightarrow S_{bX}$  between all bicomact semiregular extensions  $bX$  of the space  $X$  and all  $\lambda$ -strengthenings of the spectrum  $S_X$  of this space, obtained by virtue of what has just been said, is one-to-one and preserves the order in the sense that from  $b_2X \geq b_1X$  it follows that  $S_{b_2X} \geq S_{b_1X}$ .

We prove the first assertion of Theorem 1; we take the following proposition as known:

**(A)** *Let  $\bar{X}$  be an arbitrary extension of the space  $X$ . Then, denoting by  $A$  any canonical closed (we write briefly  $\mathfrak{a}$ ) set of the space  $X$ , and by  $\bar{A}$  its closure in  $\bar{X}$ , we have  $X \cap \bar{A} = A$ , and the correspondence  $A \rightarrow \bar{A}$  is a one-to-one correspondence between all  $\mathfrak{a}$ -sets in  $X$  and all  $\mathfrak{a}$ -sets in  $\bar{X}$ , and hence also a one-to-one correspondence between all decompositions  $\alpha = \{A_\alpha^1, \dots, A_\alpha^{s_\alpha}\}$  of the space  $X$  and all decompositions  $\bar{\alpha} = \{\bar{A}_\alpha^1, \dots, \bar{A}_\alpha^{s_\alpha}\}$  of the space  $\bar{X}$ , which is an*

order isomorphism (the relations  $\alpha' > \alpha$  and  $\bar{\alpha}' > \bar{\alpha}$  are equivalent). Hence it follows at once that

**Lemma 1.** *If the spectrum  $S_X$  exists, then the spectrum  $S_{\bar{X}}$  also exists, and it is a strengthening of the spectrum  $S_X$ .*

**Lemma 2.** *If  $\bar{X}$  is a  $T_\lambda$ -extension of the space  $X$ , then  $S_{\bar{X}}$  is a correct strengthening of the spectrum  $S_X$ .*

This lemma follows easily from the following assertion:

**(B)** *Suppose that, among the elements of a decomposition  $\alpha = \{A_\alpha^1, \dots, A_\alpha^{s_\alpha}\}$  of the space  $X$ , a given point  $x \in X$  is contained in the elements  $A_\alpha^{i_0}, \dots, A_\alpha^{i_r}$ , and only in them. Then, among the elements  $\bar{A}_i$  of the corresponding decomposition  $\bar{\alpha}$ , only  $\bar{A}_\alpha^{i_0}, \dots, \bar{A}_\alpha^{i_r}$  contain the point  $x$ .*

Indeed, from  $x \in \bar{A}_\alpha^i$  it follows that  $x \in X \cap \bar{A}_\alpha^i = A_\alpha^i$ .

Let  $\bar{X}$  be a bicomact  $T_\xi$  (hence  $T_\lambda$ )-extension of the space  $X$ . Relying on Lemma 2 and Remark 3, we conclude that the spectrum  $S_{\bar{X}}$  is a  $\lambda$ -strengthening of the spectrum  $S_X$ .

The correspondence  $bX \rightarrow S_{bX}$  is one-to-one. Indeed, let the spectra  $S_{b_1X}$  and  $S_{b_2X}$  be naturally isomorphic. Since  $\tilde{S}_{b_1X} = b_1X$ ,  $\tilde{S}_{b_2X} = b_2X$  (see [2]), it follows that  $b_1X = b_2X$ .

We pass to the second part of Theorem 1.

**Lemma 3.** *Let  $X$  be an arbitrary  $T_\lambda$ -space and let  $S = \{N_\alpha, \mathfrak{G}_\alpha^{\alpha'}\}$  be a correct strengthening of the spectrum  $S_X$ . Then the limit space  $\tilde{S}$  is a bicomact  $(T_1)$ -extension of the space  $X$ , semiregular if  $S$  is a  $\lambda$ -strengthening.*

By Theorems 1 and 4 of [2], the space  $\hat{S}_X$  is a bicomact  $T_\xi$ -extension of the space  $X$ . Denoting by  $\hat{S}$  the full limiting space of the (arbitrary) spectrum  $S$  (consisting of all, and not only maximal, threads of the spectrum  $S$ , with the same topology as in  $\hat{S}$ ), we have the natural mapping  $f : \hat{S}_X \rightarrow \hat{S}$ . From the correctness of the refinement  $S$  it follows easily that under the mapping  $f$  the set  $X \subseteq \tilde{S}_X \subseteq \hat{S}_X$  is mapped topologically onto the set  $fX \subseteq \tilde{S} \subseteq \hat{S}$ . It remains to show that  $fX$  is dense in  $\tilde{S}$ .

Let  $Ost_\alpha$  be an arbitrary element of the open base of the space  $\tilde{S}$ . Take some vertex  $e_\alpha$  of the simplex  $t_\alpha \in N'_\alpha$ . Since  $X$  is dense in  $\tilde{S}_X$ , there exists a point  $x \equiv \xi(x) \in Oe_\alpha \subseteq \tilde{S}_X$ . Then  $t_\alpha(x) = e_\alpha \leq t_\alpha$ , so that (in view of the correctness of the refinement  $S$ ) we have  $\tilde{S} \ni x \equiv \xi(x) \in O_{\tilde{S}}t_\alpha$ , and  $fX$  is dense in  $\tilde{S}$ . Let  $S$  be a  $\lambda$ -refinement of the spectrum  $S_X$ . We shall prove that then the extension  $\tilde{S}$  is semiregular. For this it is enough to prove that all  $\Phi_S e_\alpha$  are  $\alpha$ -sets. This in turn follows from the equality

$$\Phi_S e_\alpha^i = [A_\alpha^i]_{\tilde{S}}, \quad (1)$$

valid for every correct refinement  $S$  of the spectrum  $S_X$  (by  $e_\alpha^i$  one always denotes the vertex of the nerve  $N_\alpha$  corresponding to the element  $A_\alpha^i$  of the cover  $\alpha$ ). Fix  $\alpha = \alpha_0$ . The inclusion  $[A_{\alpha_0}^i]_{\tilde{S}} \subseteq \Phi_S e_{\alpha^i}$  is checked directly. We prove the reverse inclusion. Let  $\xi = \{t_\alpha\} \in \Phi_S e_{\alpha^i} \subseteq \tilde{S}$ . It is required, for arbitrary  $\alpha = \alpha_1$ , to find a point  $x \equiv \xi(x) \equiv \{t_\alpha(x)\} \in A_{\alpha_0}^i$  satisfying the condition  $t_{\alpha_1}(x) \leq t_{\alpha_1} \in \xi$ . For this we take  $\alpha'$ ,  $\alpha' \geq \alpha_0, \alpha_1$ . Then  $\mathfrak{D}_{\alpha'}^{\alpha'} \cdot t_{\alpha'} = t_{\alpha_0}$ ,  $\mathfrak{D}_{\alpha_1}^{\alpha'} t_{\alpha'} = t_{\alpha_1}$ .

Let  $e_{\alpha'}^k \leq t_{\alpha'}$  be such a vertex that  $\mathfrak{D}_{\alpha'}^{\alpha'} e_{\alpha'}^k = e_{\alpha_0}^i \leq t_{\alpha_0}$ ; then  $\mathfrak{D}_{\alpha_1}^{\alpha'} e_{\alpha'}^k = e_{\alpha_1}^j \leq t_{\alpha_1}$ , and, consequently,

$$A_{\alpha'}^k \subseteq A_{\alpha_0}^i, \quad A_{\alpha'}^k \subseteq A_{\alpha_1}^j, \quad A_{\alpha_0}^i \cap IA_{\alpha_1}^j \neq \Lambda.$$

Take  $x \in A_{\alpha_0}^i \cap IA_{\alpha_1}^j$ ,  $\xi(x) = \{t_\alpha(x)\}$ . Then  $\xi(x) \equiv x \in A_{\alpha_0}^i$  and  $t_{\alpha_1}(x) = e_{\alpha_1}^j \leq t_{\alpha_1}$ , and the point  $x \equiv \xi(x)$  we need has been found.

We shall show that the one-to-one mapping  $bX \rightarrow S_{bX}$  is a mapping “onto.” For this we prove the formula

$$S_{\tilde{S}} = S, \tag{2}$$

valid for every  $\lambda$ -refinement  $S = \{N'_\alpha, \mathfrak{D}_{\alpha'}^{\alpha'}\}$  of the spectrum  $S_X = \{N_\alpha, \mathfrak{D}_{\alpha'}^{\alpha'}\}$  of the given  $T_\lambda$ -space  $X$ . Since, by Lemma 3,  $\tilde{S}$  is a bicomact  $T_\zeta$ -extension of the space  $X$ , the spectrum  $S_{\tilde{S}} = \{N''_\alpha, \mathfrak{D}_{\alpha'}^{\alpha'}\}$  is a  $\lambda$ -refinement of the spectrum  $S_X$ . It remains to prove that the spectrum  $S_{\tilde{S}} = \{N''_\alpha, \mathfrak{D}_{\alpha'}^{\alpha'}\}$  is naturally isomorphic to  $S$ , which follows from the assertion

- (B) The vertices  $e_{\alpha'}^{i_0}, \dots, e_{\alpha'}^{i_r}$  of the nerve  $N'_\alpha$  then and only then are the vertices of some simplex  $t_\alpha$  in the complex  $N'_\alpha$ , when  $[A_{\alpha'}^{i_0}]_{\tilde{S}} \cap \dots \cap [A_{\alpha'}^{i_r}]_{\tilde{S}} \neq \Lambda$ .

Indeed, let  $|e_{\alpha'}^{i_0}, \dots, e_{\alpha'}^{i_r}| = t_\alpha \in N'_\alpha$ . Since the spectrum  $S$  is complete [4],  $\Lambda \neq \Phi_S t_\alpha = \Phi_S e_{\alpha'}^{i_0} \cap \dots \cap \Phi_S e_{\alpha'}^{i_r}$  and  $[A_{\alpha'}^{i_0}]_{\tilde{S}} \cap \dots \cap [A_{\alpha'}^{i_r}]_{\tilde{S}} \neq \Lambda$  by virtue of formula (1).

Conversely, let  $\Lambda \neq [A_{\alpha'}^{i_0}]_{\tilde{S}} \cap \dots \cap [A_{\alpha'}^{i_r}]_{\tilde{S}} = \Phi_S e_{\alpha'}^{i_0} \cap \dots \cap \Phi_S e_{\alpha'}^{i_r} \ni \xi = \{t_\alpha\}$ . Then the vertices  $e_{\alpha'}^{i_0}, \dots, e_{\alpha'}^{i_r}$  are vertices of the simplex  $t_\alpha$ , and the simplex  $|e_{\alpha'}^{i_0} \dots e_{\alpha'}^{i_r}| \in N'_\alpha$  exists.

We prove that from  $b_2X \geq b_1X$  it follows that  $S_{b_2X} \geq S_{b_1X}$ . But if  $b_2X \geq b_1X$ , then from  $[A_{\alpha'}^{i_0}]_{b_2X} \cap \dots \cap [A_{\alpha'}^{i_r}]_{b_2X} \neq \Lambda$  it follows that  $[A_{\alpha'}^{i_0}]_{b_1X} \cap \dots \cap [A_{\alpha'}^{i_r}]_{b_1X} \neq \Lambda$ , and hence  $S_{b_1X}$  is a natural refinement of the spectrum  $S_{b_2X}$ .

**Definition 4\*.** A thread  $\xi = \{t_\alpha\}$  of a spectrum  $S = \{K_\alpha, \mathfrak{D}_{\alpha'}^{\alpha'}\}$  is called **regular** if for every  $\alpha$  there exist  $\alpha'$ ,  $\alpha' \geq \alpha$ , such that

\* In [4], V. I. Ponomarev gave another definition of regularity, equivalent to ours for all complete spectra.

that every simplex  $t'_{\alpha'} \in K_{\alpha'}$  having a common face with the simplex  $t_{\alpha} \in \xi$  is projected into a face of the simplex  $t_{\alpha} \in \xi$ :  $\delta_{\alpha'} t_{\alpha'} \leq t_{\alpha}$ .

A spectrum all of whose maximal threads are regular is called regular; its limit space is regular (Ponomarev).

A regular spectrum  $S = \{N_{\alpha}, \delta_{\alpha'}\}$  which is a correct strengthening of the spectrum  $S_X$  of a (Tychonoff) space  $X$  will be called an  $H$ -strengthening of the spectrum  $S_X$ . Its limit space  $\tilde{S}$  is a bicomact  $T_2$ -extension of the space  $X$ . Conversely, the spectrum of every bicomact  $T_2$ -extension  $bX$  is regular<sup>(4)</sup>; hence, being, by the preceding results, a correct strengthening of the spectrum  $S_X$ , it is an  $H$ -strengthening. Just as in the case of bicomact  $T_{\xi}$ -extensions, one proves the mutual one-to-one character of the mapping  $bX \rightarrow S_{bX}$  from the set of all bicomact  $T_2$ -extensions of the space  $X$  to the set of all  $H$ -strengthenings of the spectrum  $S_X$ .

This mapping is a “mapping onto,” which follows from equality (2), proved for  $H$ -strengthenings in the same way as for  $\lambda$ -strengthenings (formula (2) is valid even for any correct strengthening).

Let us prove that the mapping under consideration is an order isomorphism. We shall call a thread of a spectrum **proper** if there exists a unique maximal thread containing it. A spectrum is proper if all its threads are proper.

**Lemma 4.** *Every  $H$ -strengthening  $S = \{N'_{\alpha}, \delta_{\alpha'}\}$  of the spectrum  $S_X$  of a Tychonoff space  $X$  is proper.*

Indeed,  $\tilde{S}$  is a  $T_2$ -space; hence, for any two distinct points  $\xi^1 = \{t_{\alpha}^1\} \in \tilde{S}$  and  $\xi^2 = \{t_{\alpha}^2\} \in \tilde{S}$  there is an  $\alpha = \alpha_0$  such that  $O_{\alpha_0} \xi^1 \cap O_{\alpha_0} \xi^2 = \Lambda$ . Lemma 4 follows from the fact that  $t_{\alpha_0}^1 \in \xi^1$  and  $t_{\alpha_0}^2 \in \xi^2$  do not have a single common vertex  $e_{\alpha_0}^i$  (if  $e_{\alpha_0}^i$  were such a vertex, then  $O_{Se_{\alpha_0}^i} \subseteq O_{\alpha_0} \xi^1 \cap O_{\alpha_0} \xi^2$ ). But  $S$  is a correct strengthening of the spectrum  $S_X$ , and therefore  $O_{Se_{\alpha_0}^i} \neq \Lambda$ . A contradiction.

**Lemma 5.** *Let a proper spectrum  $S_i = \{C_{\alpha}, \delta_{\alpha'}\}$  be a strengthening of a (bounded) spectrum  $S = \{K_{\alpha}, \delta_{\alpha'}\}$ . Then, assigning to each maximal thread  $\xi = \{t_{\alpha}\} \in \tilde{S}$  the unique maximal thread containing it,  $f\xi = \{t_{\alpha}^{(c)}\}$ , we obtain a natural mapping  $f : \tilde{S} \rightarrow \tilde{S}_c$  onto  $\tilde{S}_c$ . If the spectrum  $S_c$  is regular, then  $f$  is continuous.*

Let us prove that  $f : \tilde{S} \rightarrow \tilde{S}_c$  is a mapping “onto.” Take arbitrarily  $\eta = \{t_{\alpha}^{(c)}\} \in \tilde{S}_c$  and in the spectrum  $[\eta] = \{[t_{\alpha}^{(c)}], \delta_{\alpha'}\}$ , where by  $[t_{\alpha}^{(c)}]$  is denoted the combinatorial closure of the simplex  $t_{\alpha}^{(c)}$ , take some zero-dimensional thread  $\eta^0 = \{e_{\alpha}\}$ . This thread is also a thread of the spectrum  $S$ , and it is contained in it in the maximal thread  $\xi = \{t_{\alpha}\}$ . Then  $f\xi = \eta$  (otherwise the thread  $\eta^0$  of

the proper spectrum  $S_c$  would have two maximal threads containing it:  $\eta$  and  $f\xi$ ). We leave the proof of the continuity of the mapping  $f$  to the reader. Thus, we have

**Theorem 2.** *Let  $X$  be an arbitrary Tychonoff space. To every bicomact Hausdorff extension  $bX$  of the space  $X$  there corresponds an  $H$ -strengthening  $S_{bX}$  of the spectrum  $S_X$ . Moreover, every  $H$ -strengthening  $S_{bX}$  of the spectrum  $S_X$  is put in correspondence with a unique Hausdorff bicomact extension  $\tilde{S} = bX$  of the space  $X$ .*

*The one-to-one correspondence  $bX \rightarrow S_{bX}$  thus obtained between the two partially ordered sets—the set of all Hausdorff bicomact extensions of the Tychonoff space  $X$  and the set of all  $H$ -strengthenings of its spectrum  $S_X$ —is an order isomorphism.*

The work was written under the supervision of P. S. Aleksandrov, to whom I express my sincere gratitude.
