**ON THE SOLVABILITY OF THE FIRST BOUNDARY-VALUE PROBLEM FOR A SECOND-ORDER ELLIPTIC EQUATION WITH DIVERGENT PRINCIPAL PART IN  $W_2^1$**

*(Presented by Academician S. L. Sobolev on 23 III 1967)*

In the paper <sup>(1)</sup>, for the uniformly elliptic equation

$$Lu \equiv \frac{\partial}{\partial x_i} (a_{ij} u_{x_j} + a_i u) + b_i u_{x_i} + au = f \tag{1}$$

in the case when  $a_i^2, b_i^2, a \in L_p$ , and  $f \in L_{2n/(n+2)}$  for  $p > n/2$  ( $n \geq 3$ ), conditions are given which ensure the existence and uniqueness of a generalized solution from  $W_2^1$  of the first boundary-value problem for equation (1). In the present paper, conditions are given which ensure the existence and uniqueness of a generalized solution from  $W_2^1$  for  $p \leq n/2$ .

First the problem is considered for the case when  $a_i^2, b_i^2, a$  belong to spaces  $L_{(r_1, r_2)}$  with mixed norm. We shall denote each point  $x$  of  $n$ -dimensional Euclidean space  $R^n$  in the form of the pair  $(\bar{x}_s, \bar{x}_{n-s})$ , where  $\bar{x}_s(x_1, x_2, \dots, x_s), \bar{x}_{n-s}(x_{s+1}, \dots, x_n)$ . By  $R^s (R^{n-s})$  we denote the  $s$ -dimensional ( $(n-s)$ -dimensional) space of points  $\bar{x}_s (\bar{x}_{n-s}), 1 \leq s \leq n$ . Let  $\Omega_s$  be an  $s$ -dimensional bounded domain in  $R^s$ ;  $\Omega_{n-s}$  an  $(n-s)$ -dimensional bounded domain in  $R^{n-s}$ , and  $\Omega = \Omega_s \times \Omega_{n-s}$ . The space  $L_{(r_1, r_2)}(\Omega_s, \Omega_{n-s})$  is defined as the set of functions  $f(x)$ , defined in  $\Omega$ , for which the norm is bounded

$$\|f\|_{L_{(r_1, r_2)}(\Omega_s, \Omega_{n-s})} = \left\| \|f(x_s, x_{n-s})\|_{L_{r_1}(\Omega_s)} \right\|_{L_{r_2}(\Omega_{n-s})},$$

where

$$\|\cdot\|_{L_{r_i}(D)} = \begin{cases} \left( \int_D |\cdot|^{r_i} d\omega^i \right)^{1/r_i}, & \text{if } 1 \leq r_i < \infty, \\ \text{vrai max}_D |\cdot|, & \text{if } r_i = \infty. \end{cases}$$

**Lemma 1.** *If the positive numbers  $r_1, r_2, q_1, q_2$  satisfy at least one of the following three conditions: a)  $r_1 < q_1, q_2 < r_2$ ; b)  $r_2 < q_1, q_2 < r_1$ ; c)  $(r_1, r_2), (q_1, q_2)$  are distinct solutions of the equation  $2x_1x_2 - (n-s)x_1 - sx_2 - \alpha = 0, \alpha > 0$ , then*

$$(L_{(r_1, r_2)}(\Omega) \cup L_{(q_1, q_2)}(\Omega)) \setminus L_{(r_1, r_2)}(\Omega) \neq \emptyset, \quad (L_{(r_1, r_2)}(\Omega) \cup L_{(q_1, q_2)}(\Omega)) \setminus L_{(q_1, q_2)}(\Omega) \neq \emptyset,$$

$\emptyset$  is the empty set.

We denote by  $X^\alpha$  the following class of Banach spaces ( $\alpha$  is any positive number):

$$X^\alpha = \left\{ L_{(r_1, r_2)}(\Omega), \begin{array}{l} 2r_1r_2 - (n-s)r_1 - sr_2 - \alpha = 0, \quad \alpha > 0, \\ \infty > r_1 > \begin{cases} 1, & \text{if } s = 1, \\ s/2, & \text{if } s \geq 2, \end{cases} \\ \infty > r_2 > \begin{cases} 1, & \text{if } n-s = 1, \\ (n-s)/2, & \text{if } n-s \geq 2. \end{cases} \end{array} \right\}.$$

We note that any two spaces  $L_{(r_1, r_2)}(\Omega), L_{(\bar{r}_1, \bar{r}_2)}(\Omega)$ , belonging to  $X^\alpha$ , are distinct if only  $r_1 \neq \bar{r}_1$  and  $r_2 \neq \bar{r}_2$ .

By  $D_\alpha$  we denote the set of those points  $(r_1, r_2)$  of the plane  $r_1Or_2$  for which  $L_{(r_1, r_2)}(\Omega) \subset X^\alpha$ .

**Theorem 1.** If  $p_i = 2r'_i$  ( $i = 1, 2$ ),  $1/r_i + 1/r'_i = 1, (r_1, r_2) \in D_\alpha$ , then

$$\|v\|_{L_2(\Omega)} \leq c_0 (\text{mes } \Omega_{n-s})^{1/\rho-1/q} \|\nabla v\|_{L_2(\Omega)}, \quad \forall v \in \dot{W}_2^1(\Omega); \quad (2)$$

$$\|u\|_{L_{(p_1, p_2)}(\Omega)} \leq c \|u\|_{W_2^1(\Omega)}, \quad \forall u \in W_2^1(\Omega), \quad (3)$$

$$\|v\|_{L_{(p_1, p_2)}(\Omega)} \leq c_1 \|\nabla v\|_{L_2(\Omega)}, \quad \forall v \in \dot{W}_2^1(\Omega); \quad (4)$$

$$\|v\|_{L_{(p_1, p_2)}(\Omega)}^2 \leq \tilde{c} [\varepsilon \beta \|\nabla v\|_{L_2(\Omega)}^2 + \varepsilon^{-1/(1-\beta)} (1-\beta) \|v\|_{L_2(\Omega)}^2], \quad \forall v \in \dot{W}_2^1(\Omega), \quad (5)$$

where  $\varepsilon$  is any positive number; the numbers  $\beta, \rho$ , and  $q$  are such that  $0 < \beta < 1; 1 < \rho < 2 < q, 1/2r_2 < 1/\rho - 1/q < 1/2(n-s)$ ; the constants  $c, c_1$  depend on  $\Omega$ , while  $c_0, \tilde{c}$  do not depend on  $\Omega$ ;  $\Omega_i$  ( $i = s, n-s$ ) satisfy the cone condition.

Let  $(r_1, r_2)$  be a fixed point belonging to  $D_\alpha$ . We shall assume that the coefficients and the free term of equation (1) satisfy the conditions

$$\nu \xi_i \xi_i \leq a_{ij} \xi_i \xi_j \leq \mu \xi_i \xi_i, \quad \nu, \mu = \text{const} > 0; \quad (6)$$

$$\|a_i^2, b_i^2, a\|_{L_{(r_1, r_2)}(\Omega)} \leq \mu; \quad (7)$$

$$\|f\|_{L_{(p'_1, p'_2)}(\Omega)} < \infty. \quad (8)$$

We denote

$$a_0 = (\text{mes } \Omega)^{-1} \int_{\Omega} a(x) dx, \quad a(x) = a^+(x) - a^-(x), \quad (9)$$

where

$$a^+(x) = \max\{a(x) - a_0; 0\}, \quad a^-(x) = -a_0 + \max\{-a(x) + a_0; 0\},$$

$$M \equiv \max\{\|(b_i - a_i)^2\|_{L_{(r_1, r_2)}(\Omega)}, \|a^+\|_{L_{(r_1, r_2)}(\Omega)}\},$$

$$c_2 = 2Mc^2\nu^{-2}(1 + 2\nu)(\beta^{-1} - 1)\beta^{1/(1-\beta)}.$$

A generalized solution from  $W_2^1(\Omega)$  of the first boundary-value problem for equation (1) is a function  $u(x)$  belonging to  $W_2^1(\Omega)$  and satisfying the identity

$$L(u, \eta) \equiv \int_{\Omega} [(a_{ij}u_{x_j} + a_i u)\eta_{x_i} - (b_i u_{x_i} + au)\eta] dx = - \int_{\Omega} f\eta dx$$

for every  $\eta(x)$  from  $W_2^1(\Omega)$ , and the condition

$$u(x) - \varphi(x) \in \dot{W}_2^1(\Omega),$$

where  $\varphi(x)$  is an extension from the boundary  $\Gamma$  to the whole domain  $\Omega$  of the function  $\tilde{\varphi}(z)$  determining the boundary values of  $u(x)$ , i.e.

$$u|_{\Gamma} = \varphi|_{\Gamma}. \quad (10)$$

**Theorem 2.** Let  $(r_1, r_2) \subset D_{\alpha}$ . If conditions (6), (7) and

$$\left(2c_2 + \frac{8}{\nu}a_0\right) c_0^2 (\text{mes } \Omega_{n-s})^{2/\rho-2/q} < 1, \quad (11)$$

are fulfilled, then problem (1), (10) has at most one generalized solution from  $W_2^1(\Omega)$ .

**Corollary 1.** For any differential operator  $L$ , defined in  $\Omega$  and satisfying conditions (6) and (7), the uniqueness theorem for the Dirichlet problem is valid in any subdomain  $\Omega' = \Omega'_s \times \Omega'_{n-s}$  of the domain  $\Omega$ , provided only that  $\text{mes}\Omega$  is sufficiently small.

**Corollary 2.** In domains of arbitrary dimension the uniqueness theorem for the Dirichlet problem holds for the operators  $L - \lambda E$ ,  $\lambda \geq \lambda_0$ , if  $L$  satisfies conditions (6) and (7), and  $\lambda_0$  is sufficiently large.

**Corollary 3.** Theorem 2 is valid for any point  $(r_1, r_2) \in D_\alpha$ .

**Corollary 4.** Theorem 2 is valid for any  $\alpha > 0$ .

**Theorem 3.** Let  $(r_1, r_2) \in D_\alpha$ . If conditions (6), (7) are satisfied and, in addition, the estimate

$$c_2 + \frac{4}{\gamma} a_0 \leq 0, \quad (12)$$

holds, then problem (1), (10) has a generalized solution from  $W_2^1(\Omega)$  for any  $f$  from  $L_{(p'_1, p'_2)}(\Omega)$  and  $\varphi(x)$  from  $W_2^1(\Omega)$ .

Define the sets  $\widehat{X}^\alpha$  and  $\widetilde{X}^\alpha$ :

$$\widehat{X}^\alpha = \bigcup_{(r_1, r_2) \in D_\alpha} L_{r_1, r_2}(\Omega), \quad \widetilde{X}^\alpha = \bigcup_{\substack{p_i = 2r'_i \\ (r_1, r_2) \in D_\alpha}} L_{(p'_1, p'_2)}(\Omega).$$

**Theorem 4.** If  $a_i^2, b_i^2, a \in \widehat{X}^\alpha$  and

$$\|a_i^2\|_{L_{(r_1^i, r_2^i)}(\Omega)}, \quad \|b_i^2\|_{L_{(\bar{r}_1^i, \bar{r}_2^i)}(\Omega)}, \quad \|a\|_{L_{(r_1, r_2)}(\Omega)} \leq \mu,$$

then, under conditions (6) and (11), problem (1), (10) has at most one generalized solution from  $W_2^1(\Omega)$ .

**Theorem 5.** Under the conditions of the preceding theorem, problem (1), (10) has a generalized solution  $u$  from  $W_2^1(\Omega)$  for any  $f \in \widetilde{X}^\alpha$  and  $\varphi$  from  $W_2^1(\Omega)$ .

Let

$$\widehat{X}_p^\alpha = \bigcup_{\substack{p < r_1, r_2 \\ (r_1, r_2) \in D_\alpha}} L_{(r_1, r_2)}(\Omega), \quad \overline{X}_p^\alpha = \left\{ L_{(r_1, r_2)}(\Omega); \begin{array}{l} p \leq r_1, r_2, \\ (r_1, r_2) \in D_\alpha \end{array} \right\}.$$

**Lemma 2.**  $\widehat{X}_p^\alpha \subset L_p(\Omega)$ .

From Theorem 4 and Lemma 2 it follows:

**Theorem 4'.** Let  $a_i^2, b_i^2, a \in L_p, p \geq 1$ . If  $a_i^2, b_i^2, a \in \widehat{X}_p^\alpha$  and

$$\|a_i^2\|_{L_{(r_1^i, r_2^i)}(\Omega)}, \quad \|b_i^2\|_{L_{(\tilde{r}_1^i, \tilde{r}_2^i)}(\Omega)}, \quad \|a\|_{L_{\simeq(r_1, r_2)}(\Omega)} \leq \mu,$$

where

$$L_{(r_1^i, r_2^i)}(\Omega), \quad L_{(\tilde{r}_1^i, \tilde{r}_2^i)}(\Omega), \quad L_{\simeq(r_1, r_2)}(\Omega) \in \overline{X}_p^\alpha,$$

then, under conditions (6) and (11), problem (1), (10) cannot have more than one generalized solution.

**Theorem 5'.** Under the conditions of the preceding theorem, problem (1), (10) has a generalized solution  $u$  from  $W_2^1(\Omega)$  for any  $f$  from  $\widetilde{X}^\alpha$  and  $\varphi$  from  $W_2^1(\Omega)$ .

Denote

$$I_1(v, \xi) = \int_{\Omega} (a_i v \eta_{x_i} - b_i v_{x_i} \eta - a^+ v \eta) dx, \quad [u, v] = \int_{\Omega} (a_{ij} u_{x_i} \bar{v}_{x_j} + \bar{a} u \bar{v}) dx,$$

$$l_\lambda(\eta) = -L(\varphi, \eta) - (f, \eta) - \lambda(\varphi, \eta). \quad (13)$$

We define the operators  $A$  and  $B$  by the equalities

$$[Av, \eta] = I_1(v, \eta), \quad [Bv, \eta] = (v, \eta). \quad (14)$$

**Theorem 6.** Suppose that conditions (6), (7), and (12) are satisfied; then the problem

$$Lu - \lambda u = f, \quad (15)$$

$$u|_{\Gamma} = \varphi|_{\Gamma} \quad (16)$$

has a unique generalized solution in  $W_2^1(\Omega)$  for arbitrary  $\varphi$  in  $W_2^1(\Omega)$  and  $f$  in  $L_p$ , for all  $\lambda$  in the complex plane except for a countable set  $\lambda = \lambda_k, k = 1, 2, \dots$

To each  $\lambda = \lambda_k$  there corresponds a finite number of linearly independent solutions in  $W_2^1(\Omega)$  of the equation

$$Lv - \lambda v = 0. \quad (17)$$

For  $\lambda = \lambda_k$ ,  $k = 1, 2, \dots$ , problem (15), (16) has a solution if and only if the conditions

$$l_{\lambda_k}(\omega_k^i) = 0, \quad i = 1, 2, \dots, N_k, \quad (18)$$

are satisfied, where  $\omega_k^i$  are all the solutions in  $W_2^1$  of the equation

$$(E + A^*)\omega + \bar{\lambda}_k B\omega = 0 \quad (19)$$

adjoint to the equation

$$v + \lambda(E + A)^{-1}Bv = 0. \quad (20)$$

The number of conditions (18) coincides with the number of linearly independent solutions of equation (20) for  $\lambda = \lambda_k$ .

**Theorem 7.** Suppose that for all operators  $L^m$ ,  $m = 1, 2, \dots$ , of the form (1), the conditions of Theorem 3 are satisfied with the same constants. Suppose that  $a_{ij}^m(x)$ , while remaining uniformly bounded, converge almost everywhere to  $a_{ij}(x)$ , and that the functions  $a_i^m$ ,  $b_i^m$ ,  $a^m$ ,  $f^m$ ,  $\varphi^m$  converge to  $a_i$ ,  $b_i$ ,  $a$ ,  $f$ ,  $\varphi$  in the norms  $L_{(2r_1, 2r_2)}$ ,  $L_{(2r_1, 2r_2)}$ ,  $L_{(r_1, r_2)}$ ,  $L_{(p'_1, p'_2)}$ ,  $W_2^1$ , respectively.

Then the generalized solutions  $u^m$  in  $W_2^1(\Omega)$  of the problems

$$L^m u = f^m, \quad u|_{\Gamma} = \varphi^m|_{\Gamma} \quad (21)$$

converge strongly in  $W_2^1(\Omega)$  to the generalized solution in  $W_2^1(\Omega)$  of the limiting problem (1), (10).
