# ON A PROJECTION OPERATOR OF S. L. SOBOLEV TYPE

(Presented by Academician S. L. Sobolev on 9 IV 1969)

In the work of S. L. Sobolev (<sup>1</sup>), for the space  $L_p^{(m)}(\Omega)$  a projection operator  $\Pi$  was constructed whose range is the space of polynomials of degree not greater than  $m - 1$ . This operator  $\Pi$  has the property that for any function  $u(x) \in L_p^{(m)}(\Omega)$  there is a representation

$$u(x) - \Pi u(x) = \sum_{|\alpha|=m} Q_\alpha(D^\alpha u(x)), \quad (1)$$

where  $Q_\alpha$  is a certain linear bounded operator mapping  $L_p(\Omega)$  into itself. Representations of the form (1) were later generalized in various directions (see (<sup>2-4</sup>)). In (<sup>5</sup>), applications of such representations were given to the proof of solvability of the first boundary-value problem for one class of degenerate equations.

In the present note a projection operator  $\Pi$  is constructed, and a representation of the form (1) is obtained for a certain collection  $\mathcal{L}_1, \mathcal{L}_2, \dots, \mathcal{L}_R$  of partial differential operators that are products of ordinary differential operators with respect to different variables. The corresponding result of (<sup>5</sup>) is contained here as a special case.

Let us first introduce a number of notations:  $n$  and  $R$  are a fixed pair of natural numbers; the letters  $i$  and  $k$  below will denote natural numbers not exceeding  $n$  and  $R$ , respectively;  $\bar{E}$  is the extended real line;  $E_n$  is the  $n$ -dimensional Euclidean space of points  $x = (x_1, \dots, x_n)$ . The remaining notations will be introduced in the course of the exposition.

Suppose that for each  $i$  an interval  $(a_i, c_i)$  is given on the axis  $Ox_i$  of the space  $E_n$ , where  $a_i$  and  $c_i \in \bar{E}$ . This means that  $-\infty \leq a_i < c_i \leq \infty$ . Put  $D = (a_1, c_1) \times \dots \times (a_n, c_n)$ .

Let, further, to each  $k$  there correspond a set  $(m_{1,k}, m_{2,k}, \dots, m_{n,k})$  of  $n$  non-negative integers and an operator  $\mathcal{L}_k = \mathcal{L}_{1,k} \mathcal{L}_{2,k} \dots \mathcal{L}_{n,k}$ , whose domain is the space  $C^{(\infty)}(D)$ , and for each  $i$

$$\mathcal{L}_{i,k} = \begin{cases} \frac{\partial^{m_{i,k}}}{\partial x_i^{m_{i,k}}} + \sum_{j=1}^{m_{i,k}} b_{i,k}^{(j)}(x_i) \frac{\partial^{j-1}}{\partial x_i^{j-1}}, & \text{if } m_{i,k} > 0, \\ I \text{ ( } I \text{ is the identity operator),} & \text{if } m_{i,k} = 0, \end{cases}$$

where  $b_{i,k}^{(j)}(x_i) \in L_1^{\text{loc}}(D)$  for all  $j = 1, \dots, m_{i,k}$ .

If  $m_{i,k} > 0$ , then the operator  $\mathcal{L}_{i,k}$  may be regarded as an ordinary differential operator on the interval  $(a_i, c_i)$ . Let  $\{\varepsilon_{i,k}^{(j)}(x_i)\}$  ( $j = 1, \dots, m_{i,k}$ ) be its fundamental system of solutions on the indicated interval. We denote the linear span of this system by  $S_{i,k}$ . If  $m_{i,k} = 0$ , then put  $S_{i,k} = \{0\}$ , where  $\{0\}$  denotes the set consisting of the single function identically equal to zero on  $(a_i, c_i)$ . This notation will be used below.

For each pair  $(i, k)$  let us consider the set  $\Psi_{i,k}$  of all possible tuples  $\tau = (k_1, \dots, k_l)$  ( $1 \leq l \leq R$  and  $l$ , generally speaking, depends on  $\tau$ ) of natural numbers satisfying the following conditions: 1)  $k < k_1 < \dots < k_l \leq R$ ; 2) there is a tuple  $(i_1, i_2, \dots, i_R)$  of  $R$  natural numbers not exceeding  $n$  such that  $m_{i_1,1} > 0, \dots, m_{i_R,R} > 0$ , and, moreover,

$$i_k = i_{k_1} = \dots = i_{k_l} = i,$$

while  $i_j \neq i$  for  $j > k$  and  $j \neq k_1, \dots, j \neq k_l$ .

For some pairs  $(i, k)$  it may happen that  $\Psi_{i,k} = \emptyset$ . For example,  $\Psi_{i,R} = \emptyset$  for all  $i$ , and  $\Psi_{i,k} = \emptyset$  when  $m_{i,k} = 0$ .

If  $\Psi_{i,k} \neq \emptyset$ , then for any tuple  $\tau = (k_1, \dots, k_l) \in \Psi_{i,k}$  we introduce the sets  $S_{i,k}^{(\tau)}$  and  $\Gamma_{i,k}^{(\tau)}$  of functions defined on the interval  $(a_i, c_i)$ :

$$S_{i,k}^{(\tau)} = \bigcap_{1 \leq j \leq l} S_{i,k_j}; \quad \Gamma_{i,k}^{(\tau)} = S_{i,k} \cap S_{i,k}^{(\tau)}.$$

Now, for each pair  $(i, k)$ , we formulate

**Condition A.** One of the following assertions is true:

- 1)  $\Psi_{i,k} = \emptyset$ ;
- 2)  $\Psi_{i,k} \neq \emptyset$ , and for every  $\tau \in \Psi_{i,k}$  there exists a subspace

$$\nabla_{i,k}^{(\tau)} \subset S_{i,k}^{(\tau)}$$

such that

$$S_{i,k}^{(\tau)} = \Gamma_{i,k}^{(\tau)} \oplus \nabla_{i,k}^{(\tau)},$$

and

$$S_{i,k} \cap \nabla_{i,k} = \{0\},$$

where  $\nabla_{i,k}$  is the space spanned by

$$\bigcup_{\tau \in \Psi_{i,k}} \nabla_{i,k}^{(\tau)}.$$

(For the notation and terminology, see (6), pp. 30 and 44, 46.)

Everywhere in what follows it is assumed that for every pair  $(i, k)$  condition A is fulfilled and, in the case when  $\Psi_{i,k} \neq \emptyset$ , the family of spaces

$$\{\nabla_{i,k}^{(\tau)}\} \quad (\tau \in \Psi_{i,k})$$

is fixed.

**Lemma.** Let  $m_{i,k} > 0$ . Then there exists a system of functions

$$\{f_{i,k}^{(j)}(x_i)\} \quad (j = 1, \dots, m_{i,k}),$$

defined on the interval  $(a_i, c_i)$ , finite and infinitely differentiable, which has the property that

$$\int_{a_i}^{c_i} f_{i,k}^{(j)}(x_i) e_{i,k}^{(s)}(x_i) dx_i = \delta_{js},$$

where  $\delta_{js}$  is the Kronecker symbol, and, in the case when  $\Psi_{i,k} \neq \emptyset$ ,

$$\int_{a_i}^{c_i} f_{i,k}^{(j)}(x_i) v(x_i) dx_i = 0$$

for any function  $v(x_i) \in \nabla_{i,k}$  and for all  $j = 1, \dots, m_{i,k}$ .

If  $m_{i,k} > 0$ , then the functions  $\{e_{i,k}^{(j)}(x_i)\}$  and the functions  $\{f_{i,k}^{(j)}(x_i)\}$  ( $j = 1, \dots, m_{i,k}$ ) appearing in the lemma will be regarded as fixed and defined on the whole domain  $D$ .

We construct the projection operator  $\Pi_{i,k}$ , defining it on functions  $u(x)$  from  $L_1^{\text{loc}}(D)$ , in the case  $m_{i,k} > 0$ , as follows:

$$\Pi_{i,k} u(x) = \sum_{j=1}^{m_{i,k}} \left( \int_{a_i}^{c_i} f_{i,k}^{(j)}(\xi_i) u(x_1, \dots, x_{i-1}, \xi_i, x_{i+1}, \dots, x_n) d\xi_i \right) e_{i,k}^{(j)}(x_i).$$

If  $m_{i,k} = 0$ , then  $\Pi_{i,k}$  will be regarded as the zero operator on the space  $L_1^{\text{loc}}(D)$ .

We now define the operators  $\Pi_k$  and  $\Pi$ , mapping the space  $L_1^{\text{loc}}(D)$  into itself. Put

$$\Pi_k = I - (I - \Pi_{1,k})(I - \Pi_{2,k}) \cdots (I - \Pi_{n,k}) \quad (k = 1, \dots, R),$$

$$\Pi = \Pi_1 \Pi_2 \cdots \Pi_R \quad (I \text{ is the identity operator}).$$

**Theorem 1.** The following equalities hold:

$$\Pi_k^2 = \Pi_k, \quad \Pi_k \Pi = \Pi \quad (k = 1, \dots, R); \quad \Pi^2 = \Pi.$$

**Definition.** An additive and homogeneous operator  $Q$  mapping the space  $L_1^{\text{loc}}(D)$  into itself will be called **strongly continuous** if for every compact set  $K^{(1)} \subset D$  there exists a compact set  $K^{(2)} \subset D$ , depending, generally speaking, on  $K^{(1)}$ , such that for all functions  $w(x) \in L_1^{\text{loc}}(D)$  the inequality

$$\|Qw(x)\|_{L_1(K^{(1)})} \leq C\|w(x)\|_{L_1(K^{(2)})},$$

holds, where  $C$  is a real number independent of  $w(x)$ .

**Theorem 2.** For any function  $u(x) \in C^{(\infty)}(D)$  and any  $k$ , the equality

$$u(x) - \Pi_k u(x) = T_k(\mathcal{L}_k u(x)), \quad (2)$$

holds, where  $T_k$  is a strongly continuous operator in the space  $L_1^{\text{loc}}(D)$ , possessing the property that  $T_k w(x) = 0$  implies  $w(x) = 0$ .

**Theorem 3.** For any function  $u(x) \in C^{(\infty)}(D)$  and any collection  $\beta = (\beta_1, \dots, \beta_n)$  of nonnegative integers such that  $\beta_i \leq \min_{1 \leq k \leq R} m_{i,k}$  ( $i = 1, \dots, n$ ), the equality

$$\mathcal{D}^\beta(u(x) - \Pi u(x)) = \sum_{k=1}^R Q_k^{(\beta)}(\mathcal{L}_k u(x)), \quad (3)$$

holds, where  $Q_k^{(\beta)}$  ( $k = 1, \dots, R$ ) are strongly continuous operators in the space  $L_1^{\text{loc}}(D)$ .

**Remark 1.** The operators  $\Pi_{i,k}$ ,  $\Pi_k$ , and  $\Pi$  are, obviously, strongly continuous in the space  $L_1^{\text{loc}}(D)$ .

**Remark 2.** Equalities (2) and (3) are in fact valid, of course, for a class of functions broader than  $C^{(\infty)}(D)$ . This class will not be defined here; however, let us note that, for example, equality (3) with  $\beta = (0, \dots, 0)$ , and in the case when all the operators  $\mathcal{L}_{i,k}$  with  $m_{i,k} > 0$  have constant coefficients, is valid for all functions for which in the domain  $D$  there exist generalized, in the sense of S. L. Sobolev, operators  $\mathcal{L}_1, \mathcal{L}_2, \dots, \mathcal{L}_R$ , as is easily verified by means of passage to the limit in equality (3).
